THE following is the conclusion of the description of Cluny Abbey, furnished to the *Glasgow Herald* by Mr. Dalrymple Duncan. It is deplorable to follow the story of the decline of the order culminating in the destruction of the abbey. As has already been mentioned, the Cluniacs, despite the rigorous basis on which the order had originally been established, were at an early period of their history betrayed by their wealth and power into habits of laxity, and it was as a protest against their luxurious mode of life that the Cistercian Order was founded in 1098 by Robert de Molesmes. As time went on this lack of discipline continued to prevail, and nothing can have contributed more to it than the unfortunate system which prevailed in later times of appointing Abbés Commenditaires ("vraye sappe de l'estat monastique et ruine des bonnes monasteres") who were either church dignitaries of high rank or younger sons of the great houses. These "Tulchan" abbots (among whom were men of the type of the Cardinal de Guise, Richelieu, Mazarin, the Prince de Conti, &c.) were merely tempted to accept the post by the revenues attached to it, and being uniformly non-resident had no interest either in furthering the welfare of the order or putting an end to the abuses which existed in it. During the latter portion of the eighteenth century disaffection arose among the tenants, and the rents and tithes became difficult to collect. The first indication of the gathering storm was the descent on the Abbey of July 29, 1789, of an armed band of peasants intent on plunder, but though the townsfolk of Cluny had had their own quarrels and disputes with the monks they rallied to the rescue, and the marauders were driven away. The final blow was not long delayed, for it could not be expected that the possessions of the Abbey, diminished though they were, would escape the unscrupulous and greedy hands of the National Assembly; and by a decree of that body, dated November 2 and 4, 1789, the goods of the monastery were confiscated. The monks were not at first disturbed, but orders for their ejection were subsequently issued, and in October, 1790, they were driven forth. The municipality of Cluny seems to have done everything possible to save the church and secure that the monastic buildings should be devoted to some great public purpose, such as a hospital for veterans, &c. Again and again representations on the subject were presented, but the efforts were futile. On April 21, 1799 (2 Floréal An VI) in the days of the Directoire, long after the fall of Robespierre, and at a time when one would have expected better things, the church, the abbot's palace, the domestic buildings and the extensive gardens were sold to three speculators at the price of 2,014,000 francs. The purchasers very soon set about the removal of the monuments and interior ornaments of the church, whereupon the indefatigable municipality addressed a complaint to the Préfet of the Department, who forwarded it to Chaptal, the Minister of the Interior. The latter replied in November 1800 condemning the spoliation, and ordering it to be put a stop to. In the following year an expert who had been instructed to examine the church reported that, although the roof needed considerable repairs, the building was still intact, and strongly urged upon the Government the duty of re-purchasing from the proprietors so important a monument. All was vain, and the purchasers, who had been willing enough to come to terms, proceeded to make the most of their bargain. In the end of 1801 they drove a street right through the nave of the church, but the building, though mutilated, was not as yet irretrievably destroyed, the choir and the two transepts being still untouched. Strong efforts were put forth to save them, and as the kaleidoscopic Government of France had now taken the form of the Consulate, hopes were entertained that the mistaken policy of the preceding years would be reversed. Not a finger was, however, raised, and the work of destruction began, the operations extending from 1806 to 1817. The pulling down of the façade took place in 1810, requiring nine days' constant work; and, according to Bouché, a contemporary writer, the *débris* amounted to 640 cubic mètres of rubble, without counting hewn stone. In 1811 the northern arm of the great transept was destroyed. So strongly built was it that seventy-five mines were exploded in it before its demolition was accomplished.

Thus perished by the insensate folly and the crass supineness of Frenchmen a church which, had it been preserved, would have been one of the chief architectural glories of their country.

The main portion of the site is now occupied by a *haras*, or Government breeding-stable, a class of institutions established throughout France for the purpose of improving the quality of the horses, and the only parts of St. Hugues' great work at present existing are some fragments of the south wall of the nave, and the southern arm of the great transept with its tower. The latter was saved by the efforts of a maire of Cluny, and has been formed into the chapel of the Ecole Normale de l'Enseignement Spécial, which now occupies the remains of the monastic buildings. As the traveller stands in this truncated fragment, whitewashed and inartistically furnished though it at present is, he cannot fail to be struck by

the loftiness of the vaulted roof and the massive simplicity of the architecture, and can faintly conjure up a vision of what the stately Romanesque pile must have been in the days of its pristine magnificence.

Some of the later additions to the church have also been preserved in the shape of the Chapelle de St. Martial, the Chapelle de Bourbon, the Chapelle de la Congregation, and the Sacristy. The two latter, which are now respectively the chemical lecture-room and the drawing-class room, only date from the middle of last century, and possess no interest, but the two first-mentioned chapels are fine specimens of late Gothic. The Chapelle de Bourbon derives its name from its founder—the Cardinal Jean de Bourbon, abbé of Cluny, 1456-80—and was built at the southern extremity of the eastern transept. Round it there project from the walls fifteen finely-sculptured half-length figures of patriarchs and prophets, forming corbels or consoles, on which in former times stood fifteen noble statues of the Virgin, St. Paul, St. John the Baptist, and the Twelve Apostles. All the latter have disappeared. At the side of the chapel is a small room, vaulted and highly ornamented, provided with a fireplace and a window commanding a view of the *maître-autel*. Here the abbé was able to sit in dignified seclusion and assist at the offices. It is very like the similar apartment attached to the Beauchamp Chapel in the church of Warwick.

The domestic buildings of the abbey are to a considerable extent intact, although the refectory, kitchens, &c., have been destroyed, but while they are very extensive and well and solidly built, they are of little architectural importance, the greater portions of them only dating from the latter half of last century. The earlier buildings which the presently-existing structures replaced were erected at various periods, and must have been of great interest. Part of them dated from the abbottship of St. Odillon, the refectory was built by St. Hugues, and the great cloister was the work of his successor, the Abbé Pons de Melgueil, 1109-22. Probably because the diversity of the architectural styles offended the taste of the eighteenth century for dull uniformity their removal was decided on at the suggestion of Dom Dathoze, who held the office of prior under the last two abbots, Frédéric Jérôme de la Rochefoucauld and Dominique de la Rochefoucauld. The reconstruction was begun in 1750, and was continued up to the time of the Revolution, at which latter period nearly all the old buildings had been destroyed, and arrangements had been made for the demolition of an interesting edifice to the west of the great cloister known by the name of the Palais de Pape Gélase, from the fact that it had been the residence of Gelasius II., who, when driven from Rome, sought refuge at Cluny, and died there in 1119. The events of 1789 arrested the further progress of these barbarous operations, and the stately dwelling of the old pope was spared to linger almost to our own day, surviving till 1873, when for no particular reason it was pulled down and re-erected in a similar style. The only existing portions of the earlier structures are the old abbey mill, the bakery (now formed into a blacksmith's forge), and the stable for guests' horses (now a corn market).

The vandalism of the monks in destroying buildings of so much architectural value was only a little less heinous than the action of the persons responsible for the demolition of the abbey church, and must have provided the latter with a ready retort to the attacks which were made on them.

The abbot's palace has in great measure been spared. It latterly seems to have consisted of two distinct structures connected together, though by the disappearance of the intermediate buildings they now stand separate. The earlier portion, which was erected by the Abbot Jean de Bourbon in the latter half of the fifteenth century, has to some extent been spoiled by having its lower storey converted into a school, but the upper floor is perfectly preserved, having with much appropriateness been formed into a museum and library. Two fine halls (each of which has a beautifully-sculptured chimney-piece) contain a collection of articles saved from the wreck of the abbey, the most notable being a great coffer of the fourteenth century which formerly contained the famous *Rouleaux de Cluny*, a duplicate of the catalogue of the privileges of the Holy See deposited by Innocent IV. after the Council of Lyon in 1245. In a small adjoining cloister have been gathered together a number of exquisitely-carved capitals from the abbey church, and the remains of some of the tombs of abbots and other distinguished personages who were buried in it. A few of the valuable MSS., charters, &c., belonging to the abbey, which escaped destruction, are now in the Bibliothèque Nationale at Paris.

The later portion of the palace, which was built by the Abbot Jacques d'Amboise towards the beginning of the sixteenth century, is now the Hôtel de Ville. In front of it lies the old garden of the abbots, full of a quaint grace all its own, as, supported by buttressed walls, it dominates the houses which at present surround it.

The interesting Hôtel de Cluny in Paris, so well known from containing the splendid collection of Mediæval antiquities

originally founded by M. de Sommerard, was the town residence of the abbots.

The extensive gardens of the abbey are now the garden and pleasure-ground of the Ecole Normale. Only inconsiderable remnants exist of the wall by which the monastic precincts were formerly encircled.

In old days the town of Cluny was fortified, but the walls have been demolished. Four of the towers and three of the gates still, however, exist.

The parish church of Notre-Dame was originally founded by St. Hugues at the end of the eleventh century, but it was rebuilt (with the exception of the tower) towards the end of the thirteenth century. It is a good example of the Gothic style of the period. The church of St. Marcel dates from 1159, and is a Romanesque basilica with a semicircular apse and a fine octagonal tower.

To the student of early domestic architecture Cluny affords a rich feast, for though a number of the old houses in the town have been destroyed, there are still standing at least half a dozen edifices dating from the twelfth century, while a similar number are of the thirteenth. One of the twelfth-century houses is described by M. Viollet-le-Duc in his *Dictionnaire* under the title "Maison." As, however, no beneficent Police Act has compelled the inscribing of the names of streets either at the corners or anywhere else, it is a matter of considerable difficulty to discover some of the old mansions.

I think I have said enough to show that no one will regret a day spent in Cluny, but I may add that in the excursion can be combined a visit to the Château de St.-Point, the favourite residence of Lamartine, which is only some eight miles distant. The château, while not specially notable from an architectural point of view, is interesting from its associations with the poet and from the number of relics of him it contains. He lies buried in a little churchyard close at hand.

KING'S LANGLEY.*

LANGLEY (the long pasture) is a name which is found in various counties. Two other Langleys, which were royal manors, are Langley Marish in Bucks, and Langley Whichwood Forest in Oxon. The long lea or meadow land here lies on both sides of the river Gade (now the Grand Junction Canal), extending from Two Waters at the north to Hunton Bridge at the south (about four miles). Here we are in Chiltern Langley, so called, it is supposed, because the highlands on this side the river may be considered an extension of the range of the Chilterns. The designation distinguishes it from Lees Langley, which was the land of the abbots of St. Albans (now called Abbot's Langley).

At the time of the Conquest Chiltern Langley belonged to Earl Leofwin (or Lewin), who fell at Hastings fighting like a lion over the body of his brother, King Harold. His estates were confiscated and bestowed on Robert Earl of Mortaigne, half-brother of the Conqueror, who held about 800 manors in England, Berkhamstead being one of them. His son William, Earl of Cornwall, forfeited his estates to Henry I. by rebellion in 1104; this manor then came into the king's hands; it continued to be a royal manor till 1630. Here we are concerned with the royal residence, usually called the Palace; its origin is obscure, and its history is mixed up with that of the priory, in connection with which it first comes to light. For the few notes which I have to give I am mainly indebted to the county historians and to an able paper read by Sir John Evans in 1878.

The highlands here in the early times were well wooded; at the Domesday Survey there were oaks and beeches sufficient to supply "pannage" for 240 hogs. There was good hunting ground in the forest, which probably once extended from Berkhamstead almost to London. Some of the earlier kings probably found it convenient to lodge at the manor house occasionally after a day's hunting. Where the original manor house stood it seems difficult to determine. The present residence of the lady of the manor, Mrs. R. Blackwell, is on Chippenden Common. There is Langleybury in the south, towards Hunton Bridge; the Bury generally marks the seat of the Saxon lord. There is also an old manor house in the High Street (of the village) which the villagers call King John's house. Chauncy says a royal residence was first erected in Henry III.'s reign. When the king's house came into being it seems to have been a structure distinct from the manor house, because (as we shall see presently) the king gave the latter to the friars while he still retained a residence here. The first evidence of royal sojourn is a letter of Edward I. dated from Langley, April 17, 1286. He confirmed here the charter of the foundation of the college at Ashridge. In 1294 his son, Edward of Carnarvon, entertained a large company here for several months. The

Dunstable Chronicle tells us he required 200 dishes daily for his table, and his servants swept the provisions from all the markets in the neighbourhood as far as Dunstable, and were not at all careful to pay for them. In 1299 Edward I. and Queen Margaret entertained here the Abbot of St. Albans (John de Berkhamstede), the Bishop of Norwich, the Count of Savoy, and other distinguished persons, on All Saints' Day. We may note, by the way, that the parish church is dedicated to All Saints.

Edward II. clearly had a great attachment for Chiltern Langley. In the second year of his reign he founded in his park here a house of Dominicans, or friars' preachers, in fulfilment of a vow (as stated in his charter) which he had made when in peril of death. His first grant, dated December 20, 1308, assigns them a garden lying on the south side of the parish church, and 27 perches of land adjoining, on the west, for building. If the friars put up any building there, it was clearly only a temporary lodging, for the priory was certainly here on the hill. In 1312, March 28, he made a grant of 700 marks, to be paid to the friars in yearly instalments of 100*l.* by the Abbot of St. Albans (Hugh de Eversden) out of dues which he owed the king. This would be about 1,500*l.* a year for five years in present money. The condition was that masses should be said for the king and his ancestors. The monastic church seems to have been undertaken several years before this, for it was ready for consecration in 1312, when John Dalderby, Bishop of Lincoln, commissioned the Bishop of Bath and Wells (John Drokensford) to dedicate it. It may have been designated as "Christ Church," or "St. Saviour's," because the device on the conventual seal (an engraving of which is given by Mr. Cussans) is our Lord enthroned, in an attitude of benediction; below is a kneeling king holding a model of a church. It had not been long completed when the body of Edward's unworthy favourite, Piers de Gaveston, was removed from the Black Friars church at Oxford, where it had rested two years, and reinterred here January 3, 1315, with great pomp, in the presence of the king, the archbishop Walter Reynolds, and other prelates, the chief officers of the kingdom, and fifty knights. The chronicler, John de Trokelowe, speaks of the masses which the friars were required to offer for his soul.

There is little doubt that the church was a sumptuous building. I will here say a few words about it. We have just inspected, in Mr. Hughes's garden at Hill House, fragments of the fine clustered piers of this church, of Purbeck marble. They were brought there, as I am informed, from this field before us. Sir Gilbert Scott, who saw the foundations exposed in 1831, informs us that the plan was that of a conventual church of the first class. I am now referring to a letter which he wrote to our late local secretary, Mr. Ridgway Lloyd, December 2, 1876, and which was printed. Sir G. Scott states that he was then a youth, and coming to look at this building before us, commonly called "King John's Bakehouse," he found the occupier of the field engaged in digging up the foundations of the church. He saw "the greater part of the plan, including the bases of most of the pillars, nearly in a perfect state; these were of Purbeck marble. The bases of the ordinary pillars showed that they were groups of eight shafts round a central pier, those of the crossing being larger." He took a section of one of them. Mr. Henry Betts, of Ballspod Farm, to whom we are greatly indebted to-day, has been so kind as to inform me that the person referred to was his father. He made a plan of the excavations, which Mr. Betts has most obligingly lent me, and it is now exhibited. According to the information the foundations of the church (the north wall) were about 80 yards to the south of the south corner of this building before us. The site is identified by the position of two leaden coffins marked on the plan, found between two lines of wall-foundations lying east and west, extending 200 feet or more across the field. Between these walls you observe a vault marked in the plan (it is within the site of the nave). This possibly may have been the place of Gaveston's sepulture. He probably had a sumptuous monument. Encaustic tiles were found. Sir G. Scott also picked up fragments of stained glass. The church had a lady chapel, a south aisle, and a "revestiary" (vestry), because in 1557, according to a document quoted by Sir John Evans, the lead was taken off these structures to make a conduit pipe at Windsor.

To resume the history. In 1316 the king granted the manor house and adjoining closes to the friars, also the "vesture" (loppings or underwood) of Chipperfield Wood for their fuel. The buildings must have been of considerable extent, if there was accommodation for 100 friars, the number named in an Exchequer document. There seems to be a deficiency of evidence as to the resources of the priory. The founder probably lavished considerable sums upon it, besides those which have been mentioned, certainly on the church. The St. Albans chronicler intimates that the friars were maintained out of the king's treasury—"de fisco victuros" are his words. This may account for the fact that at his death the number was reduced to thirteen. In 1372 they acquired the

* A paper read by the Rev. H. Fowler at an excursion of the St. Albans Architectural and Archæological Society, and published in the *Herts Advertiser*.

rectory and great tithes by arrangement with the prioress of Dartford, in Kent, to whom Edward III. had granted them. In 1466 Prior Thomas Betts obtained from Edward IV. the Home Park, Chipperfield Wood, Friar's Wood, Friar's Meadow and toll of grain at the King's Mill, but even these grants seem hardly sufficient to account for the fact that at the dissolution this was found to be the richest house of Dominicans in England. Dugdale gives the annual value as 150*l.*; perhaps about 1,800*l.* in present money. I will now say that the site of the priory (stated to be seven acres) was acquired in 1630 by William Houlker, who had purchased the manor. From the information which Mr. Betts has given me the site is comprised within the field before us, and the adjoining field on the east. This property, sometimes called "Priory Fields," came at length by sale to the late Mr. Herbert Ingram, and now belongs to Sir Edward Watkin. Mr. Betts informs us that large quantities of flint foundations and wrought stone have been dug up within his memory in the southern part of the field; these probably belonged to the cloister and other monastic buildings. The eastern field now belongs to Mr. Groom. The plan of excavation shows that the eastern limb of the church extended into that field. I have omitted to mention that Mr. Betts has at his house a fine Purbeck base in good preservation.

To return to the palace. Records as to the date of its erection are wanting. It was located in the park, which in 1364 had been lately enclosed by palings. We learn from the survey of the first year of Elizabeth (1558) that this was about 4½ miles in circuit, being something like a square, and containing 667 acres. The north side extended from the river side (*i.e.* the river side of the park, as I understand it, which was in the high road to London), along a road as far as Whippenden Bottom. We are now very near this north boundary; a row of trees marks it here. The limit in the south was Bury Bushes, a mile southward from this spot, and Abbot's Gate. The east side skirted the highway to London. It was a deer park, and thickly planted with oaks and beeches. The site has come to the Earl of Essex by inheritance from Sir Charles Morrison, to whom it was granted by Charles II. in 1661. It has long been disparked and laid out in farms. The site of the king's house also went with the park. On the death of Edward II. his widow, Queen Isabella, had the manor, but she did not reside here. Edward III. was in residence here on several occasions, as evidenced by his letters. He reduced the friars' establishment, but bestowed on them several favours presenting some "mazer" cups, one of which was called "The Edward." The date 1341 brings us to the person who is most interesting to us at King's Langley (the place had now begun to be called by that name). On June 5 in that year Queen Philippa gave birth here to her fifth son, known as Edmund de Langley. He was baptised at the palace by Abbot Michael de Mentmore, the godfathers being the abbot and the Earls John de Warenne and Richard de Arundel. June 9 is the Feast of the Translation of St. Edmund; if the baptism was on that day, or near it, the king's son was perhaps named after the martyred king of East Anglia. The name had, however, been borne by other Plantagenet princes. Queen Philippa, after being churchered at King's Langley, visited the abbey and offered a cloth of gold. The king held a tournament in honour of the event. When Queen Philippa died in 1369 the king added to the staff of the friars' preachers twenty brethren at a stipend of 10 marks annually, who were to pray for her soul, and this seems to indicate a chantry in the Conventual Church. It has been ascertained from the Patent Rolls that the body of Edward of Angoulême, eldest child of the Black Prince, was buried here, having been brought from Gascony. I am indebted for these and other interesting particulars to the paper of Sir John Evans.

To speak now of the site of the palace. A survey was made of the thirty-third year of Elizabeth (1591) which is very difficult to understand. According to my reading of it, we have the following information:—The extent of the buildings and courts was three acres. The principal gatehouse was on the east. It would have stood, I suppose, on the road by which we have come here. One side of the site abutted on the eastern wall of the church (I think it means the churchyard) and on the wall of the cloister. There was a building called "Verney's Lodging." On the north side, near the park paling, was another gatehouse, abutting southward on an old building called the "Eight Bays." As I understand it, the site extended northward and eastward of the priory, and was in contact with the east wall of the cemetery of the Conventual Church. This may have coincided with the eastern fence of Mr. Groom's field. Further information may enable me to form a more definite opinion. The ruinous wall which we passed is supposed to be within the site, although of more modern date. Some foundations are close to the road. Mr. W. Page has kindly given me a note from a survey of 1556 (Augmentation Office). The sites of the park and king's house were then leased to John, Lord Russell. It states the outer "court of the site of the manor, parcel of the possessions of Jane, late Queen of England, contained divers tenements and chambers, also

stables and barns." Some of the buildings were then in a ruinous condition, and some had been pulled down. A document dated 1372 mentions the royal lodge named "Little London." This Sir John Evans considers to have stood in "a moated square near the river, where encaustic tiles have been dug up."

I must now speak of the building before us. It is about 72 feet long and 20 feet wide. Its flint walls are 3 feet thick. There is an upper storey or loft. We see this western side has the remains of massive buttresses; we infer it was an external wall. The opposite side also had buttresses, which have been cut off. The three pointed arches give an architectural character. The jambs appear to be sunk in the ground. The level of the floor of the interior is about 1 foot 9 inches below the outer level. The apex of the arches is now only about 6 feet above the ground. Mr. Betts has kindly made an investigation, which shows that the height was once 8 feet at least. The doorway at the north end is of similar character. It may be of the Decorated period. Other windows inserted to render the building habitable as a cottage are comparatively modern. We see the ruined wall southwards, which shows the original extent of the range of buildings. I conjecture this to be a Mediæval cattle stable connected with the priory. The cattle would enter by these arches or one of them. It is very near the site of the palace and still nearer to the priory. The traditional name, "King John's Bakehouse," seems inexplicable.

To return to Edmund de Langley. He, perhaps, was here much in his youthful days. It is certain that the king's house was assigned to him for a residence, and at some period he received a grant of the manor, which was to descend to his heirs. It did so descend, and at last became merged in the Crown in the person of his great-grandson, Edward IV. I will now follow out the descent. The manor, with the park and palace, were granted by Edward IV. to his mother, Cecilia, Duchess of York, for her life. She did not reside here, but at Berkhamstead. Under her Sir Ralph Verney was steward and keeper of the park, and the office seems to have been held by the same family for several generations; thus "Verney's Lodgings," in the Survey, is accounted for. The property afterwards became part of the dower of Cecily's granddaughter, Elizabeth of York, wife of Henry VII., and subsequently the dower of Henry VIII.'s queens, Anne Boleyn and Jane Seymour. We have already seen that the site of the park and palace was conveyed by Charles II. to Sir Charles Morrison in 1662. The manor had been sold in 1630 to Thomas Houlker, citizen of London. It is now possessed by Mrs. Blackwell.

Edmund de Langley is a well-known figure in history. I have only to mention a few facts connecting him with this locality, which we may call his home. In 1372, on his return from Gascony, he married Isabella, of Castille, daughter of Pedro, King of Spain. John of Gaunt married her elder sister, Constantia. Isabella accompanied Edmund, then Earl of Cambridge, during his two years' campaign in Portugal. She appears to have been a devoted wife, although the St. Albans chronicler represents her as "worldly and trivial," but she was not a benefactress to the abbey. Edmund was created Duke of York in 1385. In 1392 King Richard II. and his queen, Anne of Bohemia, kept Christmas at Langley in the company of four bishops and various members of the court. Edmund and his duchess were present. Isabella's death occurred two years later (in 1394), probably in the palace here. She had been married twenty-two years, and was the mother of Edmund's children, Edward Earl of Rutland, Richard, afterwards Earl of Cambridge, and Constance. Richard's queen died the same year, June 7; also Constantia, Duchess of Lancaster. Isabella was certainly buried in the Priory Church. In 1396 Duke Edmund kept Christmas here in company with his brother, the Duke of Lancaster, and the king. He was then married to Joan Holland. John of Gaunt died February 3, 1399. Six months later, at the time of Bolingbroke's invasion, Duke Edmund was in charge of the kingdom as regent. The course of events compelled him to resign his office. When Henry mounted the throne his uncle Edmund, it would appear, retired into private life at Langley. We cannot say whether he was here when the corpse of King Richard was brought for interment in February 1401. The account of the St. Albans chronicler (William Wyntershyll, says Mr. Riley) seems to imply his absence. The body was brought from Pontefract (where it was commonly supposed King Richard died from the effects of voluntary abstinence from food), resting one night at St. Albans, lay in state in St. Paul's Cathedral—the face of the corpse was exposed to view from the lower part of the forehead to the throat—thence, says the chronicler, was conveyed in a funeral car attended by four knights to Langley (according to Froissart), and buried by night in the church of the friars' preachers, without any regal pomp, by the Abbot of St. Albans (John Moote), the Bishop of Chester, and William, Abbot of Waltham. No one offered hospitality to the few mourners. We know that his remains were removed to the tomb in Westminster Abbey in 1415 by

Henry V., who also founded a chantry for him at Shene. In relating the interment of Isabella of Castille in the church of the friars the chronicler adds, "where, they say, are buried the bodies of many traitors." We may infer that the monks of St. Albans had no liking for these Dominicans. Edmund de Langley had made his will a few months before King Richard's death (November 25, 1400). He directed that his body should lie at Langley close to his much-loved late consort, Isabella—"pres de ma trèsamé Isabele jady's ma compaigne." He died August 1, 1402, aged sixty-one, and was buried according to his wishes in the Conventual Church, close beside the body of Isabella; the chronicler says his body was brought to Langley and his funeral was an unostentatious one. He had given no directions about his tomb, we infer, for the good reason that it had already been erected, and his wife's remains deposited therein. Two chantry priests were appointed by his will. The tomb was probably removed to the parish church not later than 1572, for in that year Queen Elizabeth granted the monastic site to Edward Grimston, who is stated to have demolished the church and other buildings. The absence of all record is very remarkable.

BUILDING STONE.*

THE qualities necessary to the best possible building stone are workability, durability and beauty. It must also be cheap. Workability includes in its meaning accessibility, a ready yielding to quarrying operations, the absence of refractory qualities under the hammer and chisel, and a texture and grain that will hold decorative finish. Stone that cannot be quarried readily has the disadvantage of great cost to begin with. If the "raw material" is expensive, the finished product must be costly. On the other hand, if Nature has so deposited her stores that the stone is easily taken from the quarry, still, if the material is refractory in the final cutting and finishing, no matter what may be its other qualities, it cannot be a very cheap material for the builder, as it will demand an over amount of expense and delay in preparation. Still less will it be desirable if it obstinately refuses to hold finish or decoration. Stone that comes from the quarry soft and yet somewhat tough, but hardening after a time, has the finest quality of workability. This renders it easy to quarry, very responsive to the tools of the cutter, and capable of taking easily and holding permanently the finish and decorative designs of the architect's specifications. It must be kept in mind, however, in examining stone, that if it comes from the quarry wet, and for that reason easily workable, it may again take up water after drying, which would be most objectionable; but if in the process of drying in the first place it passes through a chemical change which will render it ever afterward impervious to water, the quality is just what could be wished for in this regard. Usually an examination of the outcropping surfaces of the stone in place will give a safe knowledge of its value as regards workability. Next, after the character of the stone regard must be had touching the conditions of its deposit. Too much overlying matter, whether stone or earth, will usually make the quarry work very heavy and expensive. This overlying matter, technically called "stripping," is, as a rule, quite worthless, and must be entirely removed before the stone can be worked with steam channelers or other quarrying appliances, hence the necessity of a careful examination to determine its nature and extent in each case before opening a quarry.

Durability, as applied to building stone, includes every quality tending to make the material lasting and unchangeable after it is laid in a structure. These qualities are many, and often seemingly conflicting in their nature. Hardness, elasticity, tensile strength, power to resist the greatest crushing force, imperviousness to water, and invulnerability to the attacks of air and its corrosive and disintegrative burdens, are some of the qualities, but not all. Evenness and homogeneity of composition, unity of substance, so to speak, and the power to resist extremes of heat and cold, are quite as necessary. It will be seen at once that chemical analysis must be relied on to insure the best knowledge of some of these requirements. Some otherwise good and durable limestones will become corroded and discoloured, and have their integrity destroyed by the effect of sulphurous smoke from the burning of impure coals; others will be injuriously affected by the action of rain-water, and still others by the oxidising power of the air. Some sandstones bear too much iron in their composition; others lack sufficient cohesion of the particles, whilst others yet are clayey or unequal in grain or texture. Every test of practical science should be given to stone before it is used in any building intended to be a permanent structure. As a rule, if the outcropping ledges are found to be infiltrated with water, which makes the outer surface constantly damp, the stone will not be good, for this would indicate that it would take up too much

moisture in the wall. Still, it is often the case that an apparently over-hydrous stone will dry out permanently after it is quarried and cut. Many of the sandstones, notably the better qualities of conglomerate, are of this character, and so soft when first taken out that they may be cut to any rough shape with a common axe or hatchet, but hardening after a few days' exposure so that water will not affect them.

The elasticity of stone may be tested by sawing it into long, slender strips, say 2 inches square and 3 feet long, when, if it be quite perceptibly flexible, its elasticity is good. If such a bar be suspended so as to hang free by a string and is struck a light blow with a hammer, its evenness and solidity of fibre will be attested by a clear, sweet, metallic note, not unlike that of a fine bell or that of a well-tempered steel bar. As a rule the best stone will break with a direct line of fracture, but it may be conchoidal or otherwise indirect and still be unobjectionable. Parallel lines of cleavage or of stratification are always favourable indications where other features are promising.

Resistance to crushing weight may be pretty safely inferred from solidity of texture and evenness of grain, but it is always necessary before a final acceptance to submit the material to the severest tests of an apparatus for that purpose.

In examining sandstone with a view to building purposes, the outcropping, if there be any, should be carefully scanned with a view to discovering what effect long exposure to the atmosphere and the rigours of winter may have had upon it. If the stone has "weathered" badly this will be shown by one or another sign of disintegration or demolition, and a talus of fragments and sand will be found formed at or near the base of the outcropping cliff. Often the substance of the rock will show unmistakable evidence of inequalities of structural composition, such as horizontal cavities caused by the weathering out of seams or streaks that, on account of bearing too much iron, have oxidised and crumbled away. Such stone if used in a building would prove worthless, and therefore dangerous. It is often the case, as I have observed during a long experience in civil engineering, that public bridges erected by counties are rendered unsafe by having their piers and abutments constructed of this kind of stone, and that, too, in places where most excellent material lay near at hand, and which a little knowledge of the nature of stone would have pointed out to the superintendent. Too frequently it happens that appearances of the most untrustworthy kind are relied upon where an ignorant person is set to do work which ought to be in charge of a skilled and well-informed engineer.

In judging of the probable durability of limestone, before subjecting it to any test of science, the same observations should be made as in the case of sandstone, with a view to ascertaining its weathering qualities. Any unequal discolouration of the face of the exposed ledge should be scrutinised carefully. Usually these are caused by the presence of iron in the composition of the rock. But limestones are much more injuriously affected by hidden faults of composition than are sandstones, and for this reason they demand a much more careful examination before any extensive quarries are opened. It is often the case that iron in limestone will do no more than discolour the outer surface on exposure to the action of air and rain-water; but even this is a serious defect when the stone is to be used in any structure wherein beauty is a chief object. For the rough masonry of ordinary bridges, and for the hidden foundations of buildings, a cheap and durable stone is what is most wanted, and in these discolouration is not a fatal fault.

Beauty, when applied to any building material, includes all the good qualities already enumerated, with the added value of a pleasing colour or combination of colours, and a general effectiveness of appearance when the structure in which it is used has been completed. The variegated granites undoubtedly are the most beautiful of all building materials. Next to granite the red and brown sandstones are most pleasing to the eye, but the white, grey and blue limestones are very effective, and they have the advantage over granite in that they work much more easily in ornamentation, while they take figures in relief with far more clearness of outline than do the sandstones as a rule. Architects have long since discovered the pleasing effects to be produced by using different kinds of stones in the same building, placing each where its particular qualities will best serve the general motive of the design.

As a rule, all else being equal, the stone which holds its native colour best will be most beautiful in a building, and of the stones which change colour, that will be most desirable which changes least and evenly. Some of the grey sandstones, however, change colour unevenly and give a striking and oft-times picturesque cloudiness to the surface, which adds to its effectiveness of colour in a wall. The nearly white limestones that take on by exposure a dark cream-brown hue if they do not contain too much magnesia, hold that tint very well and are quite beautiful. As a rule the presence of many large animal remains in a stone is objectionable on account of the tendency of such a composition to crumble; but where fossiliferous rock is durable it will usually be found very beautiful when cut, the organic remains bossing it over with

* By Maurice Thompson in the *Indiana Geological Report*.

variegations that greatly heighten its appearance. Stone which contains large fossils is not, however, the best for receiving raised ornamentations, such as figures in relief, no matter how durable and beautiful it may be, for the animal form will interfere with nicety of cutting and polish as well as with the regularity of the figures. Fossils will usually be found harder than the matrix in which they are set, but this is not always the case, for quite often the form is that of a hollow cast or impress filled in with material which crumbles easily. As a rule fossils, though very hard, are but loosely set in sandstone, and often they are very large and rough forms of plants extremely silicious and refractory. Blocks containing these are to be avoided as probably worthless for building purposes, however valuable and interesting they may be from a scientific point of view.

Many very beautiful stones that are not durable when exposed to the weather are very valuable for the inside finishing of buildings, where they will last for ages, holding the finest tints of their colouring without perceptible change.

From what has been said above it will be seen that every owner of stone beds should, before going to the expense of opening quarries, have his rock beds examined by an expert, whose report should show all the defects as well as all the good qualities of the material. Usually this can be done without any great outlay of labour or money, for the experienced geologist or engineer can quickly discover from the stone and its surroundings the nature of the deposit, and very simple chemical and mechanical tests will settle the question of strength and durability. There are beds of magnificent building stone lying undeveloped in many places, simply for the reason that the owners are not aware of the treasure they possess. In other places quarries are being industriously worked and the stone used in the erection of costly buildings, where in fact the material is wholly unfit for use on account of its lack of durability. I have examined many extensive structures whose stone was fast crumbling away. True, a few years will not show much decay, but in the long future the result will certainly be disastrous. The constant action of the atmosphere, the expansion and contraction consequent upon extremes of heat and cold, and the disintegrating effect of rain-water slowly but surely tell upon the integrity of the exposed parts.

THE TEMPLES AT KARNAK.

THE new director of the National Gallery has not lost his interest in Egyptian remains. The following appeal for funds has been sent out by Mr. Poynter, and deserves to obtain an immediate and liberal response:—

The great and continually growing interest which is being taken in the scheme for the proposed reservoir below the Island of Philæ on the Nile has for a time thrown into the background the object which the Society for the Preservation of the Monuments of Ancient Egypt has had in view from its first foundation. I refer to the preservation of the great temples of Karnak from further degradation caused by the crystallisation of the salts contained in the soil, which eats away the bases of the columns and walls. This destructive agent is set in action by the annual inundations of the Nile; the salts in solution penetrate the porous surface of the sandstone, and, as they crystallise in drying after the waters have retired, break off minute fragments of the stone. The result of this process repeated annually through many centuries may be seen in any photograph of the ruins; the columns, instead of resting on a broad base, have but a narrow neck for their support; this finally fails them and the column falls. Eleven out of the twelve gigantic columns which formed the avenue of approach to the Great Hall have thus given way, and the same fate awaits, no doubt, all those within reach of the inundating waters.

After consultation with Sir Colin Scott-Moncrieff, Colonel Ross, and other engineers of the Public Works Department in Cairo, our committee decided to adopt a scheme, prepared by Major Brown, R.E., of the Irrigation Department, for pumping the Nile water out of the area of the ruins, and so preventing the cause of mischief by keeping the ruins dry. The final and definite scheme consists of a steam pump and engine-house with a well, and an 18-inch pipe drain to carry the inundation water back to the Nile as fast as it enters the ruins; and by the terms of the agreement entered into by M. de Morgan, the distinguished director of the Ghizeh Museum (the assent of the Egyptian Government to our general proposal was given as far back as 1890), this society is to pay the expenses of the erection of the pump and engine-house and other works, and to provide for the working of the engine for two years; the whole to be then handed over to the Egyptian Government, who undertake to provide for the cost of continuing the work after that period—that is, the permanent working of the engine to keep down the water. In all this M. de Morgan has shown himself most favourable to our plans, and it is due to the facilities which he has given to Major Brown that we are in a position to carry out the work.

After much consultation and revision of the estimates, the cost of engineering has been brought down to 1,300*l.*, in addition to which sum 200*l.* a year will be required for two years to keep the engine going.

During the past season Major Brown has been actively at work in the intervals of leisure which he can afford from his official duties as irrigation officer of the district, and the engine-house and pump, the cost of which he estimated at 587*l.*, are by this time nearly, if not quite, completed, and he will require shortly the greater part of the sum which the society has in hand to defray their cost. Annual subscriptions promised amount to about 120*l.*, and the society has in hand from this source and from donations a sum amounting to over 700*l.*; we are therefore in want of 600*l.* more to carry out the whole work and hand it over complete to the Egyptian Government, besides which we ought to have further annual subscriptions to the amount of nearly 100*l.* a year for two years to defray the annual requirements of the engine for that time. The committee therefore make an appeal to those who are interested in the preservation of this, the most magnificent group of ruins in the world, for the funds necessary for our purpose.

Some years ago M. Marietta was reported to have said that nothing could be done for Karnak but abandon it to its inevitable fate. It is to the French engineer, Grand Bey, that the first idea of arresting the action of the *sebak* on the bases of the columns is due; when that is once stopped there seems no reason why what now remains of this Titanic structure should not stand firm for a period which, compared with the brief duration of human life, may be called eternity; nothing short of an earthquake or of intentional violence can dislodge its massive parts. There must be thousands who have visited Karnak from our own country and from America who would gladly contribute to so great a work, to be carried out at a cost comparatively so trifling, if you, sir, will allow it to be brought before them in your paper, at once so influential and so widely circulated.

Donations and subscriptions may be sent either to me or to Mr. F. G. Hilton Price, 17 Collingham Gardens, S.W., who is hon. treasurer to our special fund; and I am prepared to send our report containing details of Major Brown's scheme to any one who desires further information.

The committee are the more emboldened to ask for money because, in view of the uncertainty and delay (arising from various unavoidable causes) which have until this year attended our efforts, they have for the past two years made no call on annual subscribers for their promised assistance.

GENERAL.

The Tower Bridge will be opened to-morrow by the Prince and Princess of Wales. The *Architect* was privileged to announce the scheme to the public and to publish the original drawings of it, which were prepared by Sir Horace Jones, in order to obtain support for the project. From time to time we have followed the progress of the structure in these columns, and next week it will be our pleasing duty to describe it in its complete state.

A loan collection of pictures in water-colour and black and white, got together by Mr. W. Hughes, was opened on Monday in the Wolverhampton Art Gallery.

At the general meeting of the Royal Archaeological Institute on Wednesday, the 4th prox., papers will be read on "The Tomb of St. Hugh at Lincoln," by Mr. F. J. Willson; "The Devastation of Nubia," by Mr. Somers Clarke, F.S.A.; and on "Roman Antiquities in Carinthia," by Professor B. Lewis, M.A., F.S.A.

The Brussels International Exhibition, is postponed until the year 1897, in order that sufficient time be allowed for the construction of the buildings, which will be on a great scale.

Sir Frederic Leighton, P.R.A., has received the degree of D.C.L. from the Durham University.

Mr. J. Jackson, architect, Bradford, has designed plans of interlocking houses to supplant back-to-back houses in an economical and convenient method.

The Trustees of the National Gallery have purchased from the Earl of Northbrook *The Agony in the Garden*, by Andrea Mantegna; *St. Jerome in his Study*, by Antonello da Messina; and *The Legend of St. Giles and the Hind*, by an unknown master of the Flemish school.

Barnard's Inn has been converted into a new school for boys for the Mercers' Company. The fine old hall has, however, been preserved, and will be utilised as a dining-room for the scholars.

The Undercroft in Laurence Pountney Hill, the sole remaining undercroft in the City, it appears, is to be demolished, in spite of all the efforts to rescue so interesting an example of Mediæval art. The property belonged to the Merchant Taylors' Company, who recently sold it to the City of London Property Company.

THE **BLACKMAN VENTILATING CO., LD.,**

TRADE MARK

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.

All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

THE ELECTRIC BLACKMAN.

TRADE MARK

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW.

and Washhouses and Heating Pipes for General Warming of the Whole Establishment, for their New Baths and Washhouses. Mr. A. Hessel Tiltman, 70 Torrington Square, W.C.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz., details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obliterated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No 208.
Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

THE *Railway World*, Philadelphia, records the death of Mr. Albert Benton Pullman, at his residence near Evanston, Illinois, after a short illness. Mr. Pullman was born at Auburn, N. Y., on October 16, 1828, and received a public school education. Before reaching his majority he engaged in cabinet making at Albion, N. Y. In 1848 he removed to Grand Rapids, Michigan, where he engaged in the furniture business. In 1859 he removed to Chicago and entered into partnership with his brother, George M. Pullman, in the business of raising buildings to street levels. From 1860 to 1887 he was actively connected with the sleeping-car industry, and for nearly all that time was second vice-president of the Pullman Palace Car Company. Since 1887 he had spent his time in travel and at his home.

TENDERS FOR THE YEAR 1893.

SUMMER DRIED SEASONED STONE FOR WINTER USE.

THE MANGOTSFIELD PENNANT STONE CO., LTD.

Quarry Proprietors, Stone Merchants, Monumental Masons and Contractors.

Quarries—WINTERBOURNE, AND FRENCHAY.

Depôt—MANGOTSFIELD, MIDLAND RAILWAY.

HEAD OFFICES—**SHANNON COURT, BRISTOL.**

MANAGER—WALTER PAYNE, DOWNEND, BRISTOL.

Supply the well-known Bristol Blue Pennant Stone, better than any other Stone for Steps, Girdor Beds, Plinths, Bases, Paving, Landers, Edging, Kerb, Channelling, and all kinds of Mason Work in Stone. Local Board Surveyors should note this. Numerous Testimonials from Local Authorities. This Stone is unexcelled for Street Work, is equal to Granite in point of durability, but far superior for a firm foothold to man or beast.

Sample will be sent to Architects and Surveyors on application.

QUOTATIONS GIVEN FOR ANY SIZES OR QUANTITIES.

ESTIMATES GIVEN FOR HOME DESIGNS IN MONUMENTAL WORK.

American Merchant,

199 UPPER THAMES ST., LONDON.

Architects should specify for the new Triple-Pipe "UNION," "ROYAL UNION," and "CHAMPION UNION" patterns DIRECT RADIATORS, giving more easy, uniform and positive circulation of Water or Steam; also Walworth's Patent Wrought Tube Steam Radiators.

The Largest Stock of American Steam and Water Fittings, Valves, Tools, &c. &c.

TWENTIETH YEAR OF PUBLICATION. NOW READY.

"THE ARCHITECT'S DIARY" FOR 1894.Specially prepared for the use of **ARCHITECTS, SURVEYORS, and ENGINEERS.**

These Publications contain not only the usual Diary, ruled and printed to a particular form, specially adapted for professional use, but, in addition, an Index, a Note-Book, a Rent and Insurance Register, a Cash Book, and a Ledger, with all the usual diary information, and much special matter referring to the various Architects' and Engineers' Associations; a digest of all the Acts passed last Session; contain also cases decided in the Superior Courts of Justice during the legal year, from November 1892 to August 1893, of interest to the Profession; Regulations of the London County Council under the orders of the Council applying to Music, Dancing, Theatre, and other Licenses; complete List of Metropolitan Surveyors and Districts, with Official and Private Address; Alphabetical Index to the Practical Statutes, Stamp Duties, &c., the whole forming in **ONE VOLUME A COMPLETE SET of BOOKS for the YEAR.** The Editions are—

No. 12.—One page to a day, size 8½ in. by 5 in., cloth, gilt, 4/6. | No. 13.—Two pages a day, size 8½ in. by 5 in., cloth, gilt, 5/6.

"THE BUILDER'S DIARY" FOR 1894.Specially prepared for the use of **BUILDERS and CONTRACTORS.**

No. 11.—Two days on a page, ruled and printed to a special pattern; also contains Bill Register, Note Book, Rent, Insurance, and Mortgage Register, Cash Book, Ledger, and 180 pages of Tables of great value to all engaged in the Building Trades, in all 460 pages, size 8½ by 5, bound, whole cloth, gilt. Indexed, and pagged to end of Diary. Price 4s. 6d.

"For use in the office of Architects and Builders they are better fitted than any diaries with which we are acquainted."—*The Architect.*

"Messrs. Hudson & Kearns's Diaries need no recommendation save a trial."—*The British Architect.*

"The novel and valuable feature of these Diaries is that each volume forms in itself a complete set of books for the year."—*The Builder.*

"We have used them ourselves throughout the year with much satisfaction, and are glad now to draw attention to the new batch sent us."—*The Building News.*

"The Diaries published by Messrs. Hudson & Kearns are quite unrivalled for convenience and comprehensiveness."—*Building World.*

"These Diaries may be said to have become the Diaries for the professions for which they are issued."—*Illustrated Carpenter and Builder.*

Sole Publishers, **HUDSON & KEARNS, 83 Southwark Street, London.**

WATERLOW BROS. & LAYTON'S ARCHITECTS', SURVEYORS' & AUCTIONEERS' DIARY FOR 1894.

Containing Lists of Members of the Royal Institute of British Architects, Surveyors' Institution, Institution of Civil Engineers, Society of Architects, &c., corrected to date. In addition.

DIGEST of all the principal Acts relating to Buildings, &c.

BYE-LAWS of the London County Council.

FORMS of Conditions and Contract on taking Building Land—Agreements for letting Farms, Houses, &c.—Agreements for sale of Copyholds—Notices to Quit—Auction and Distress Forms—Conditions for sale by Private Contract.

RULES for Parsonage Houses—Queen Anne's Bounty—Planning and fitting up Schools—Committee of Council on Education—The Professional Practice and Charges of Architects—Scale of Surveyors' Fees in Compensation Cases.

PAPERS on Regulations and Directions for Redemption of Land Tax, Commutation of Tithes and Tithe Rent Charge—Poor Rates and Assessments, and Law relating to Actionable Nuisances, &c.

PRACTICAL TABLES AND CALCULATIONS for use in estimating and making Valuations—Tables of Values of Annuities.

QUALIFICATIONS of Parliamentary Voters—INSURANCE GUIDE, with Dates of Premiums.

BANKING DIRECTORY—PARLIAMENTARY DIRECTORY.

BUILDING AND BUILDERS.

THE building permits issued by the City Commissioner for the city of Toronto for the year 1893, the *Canadian Architect* says, fall short of those of the preceding year by more than 1,000,000 dols. This is partially accounted for by the fact that the permit for the new City and County buildings, amounting to 1,000,000 dols., was included in last year's record. It is yet too early to speak with any degree of authority regarding the outlook for 1894. The opinion prevails, however, that the lowest point has been reached in the depression which has prevailed in Toronto for some years past, and that the tendency will be upward in the future. It seems clear that no building of a speculative character will be done in Toronto for some years to come, and this is regarded by reputable builders and others who have at heart the welfare of the city as something to be thankful for. It is believed that a fair amount of building will be done next year in the business portion of the city.

THE same paper also says that the manufacturers of Canadian cement are complaining of the action of the Dominion Government in using imported cement in the construction of the Soulages Canal. This is the first instance, so far as we are aware, in which imported cement has been used in Canadian public works of this character. In the construction of the Welland and Sault Ste. Marie Canals Canadian cement was employed, and the durability of the material in the case of the Welland Canal at least has been amply demonstrated. No reason has been given by the Government for the use of imported cement in the Soulages Canal except that they felt bound to act on the advice of their engineer.

It is reported that a site has been fixed upon in Chelsea for the home of the British Institute of Preventive Medicine, the building of which is estimated to cost between 25,000*l.* and 30,000*l.* There will be finely-equipped laboratories, and a scientific staff will be appointed to provide for lectures, &c.

At the meeting of the Markets and Fairs Committee of the Birmingham City Council a number of instructions were drawn up for the guidance of architects in the preparation of plans for the new dead-meat market and slaughterhouses, to be erected between Bradford Street, Cheapside, and Sherlock Street East. Architects will be allowed about two months to complete the plans.

WORKS, ROTHERHAM. Estab. 1854.

DURING the past year the Dean of Guild Court of Hamilton have had before them thirty-three petitions for the erection of new buildings, the estimated cost of which is 27,940*l*. They have also disposed of thirteen petitions for alterations, the estimated outlay of which is about 3,800*l*.

ST. STEPHEN'S CHURCH, Grampound Road, Cornwall, was reopened by the Bishop of Truro, on Thursday, December 28, 1893, after undergoing a thorough restoration. The church is in many respects very interesting from an architectural standpoint, having a considerable amount of Early Norman work remaining. The restoration has been carried out at a cost of between 1,200*l*. and 1,300*l*. from the designs of Mr. Geo. N. Fellowes Prynne, F.R.I.B.A., of Westminster, by Mr. James Julian, builder, of Truro. The heating apparatus has been supplied and fixed by Mr. De Ridder, of Liverpool.

VARIETIES.

THE *Birmingham Post* says:—In these days, when "records" are so frequently broken, it may be of interest to state that 1893 has been a record year in the history of the Birmingham Fire Brigade. During the twelve months the brigade has been called out 702 times, as compared with 587 in 1892, or an increase of 115. Of the 702 calls, 489 were to actual fires, 128 to chimney alarms, and 85 were false alarms.

THE opening chapters of Miss Braddon's new story, "Thou art the Man," perhaps the most powerful she has ever written, will begin next week in the *Gentlewoman*, and will be profusely illustrated by Mr. Everard Hopkins.

THE Board of Trade have held an inquiry at Leeds with reference to an application by the Corporation for powers to borrow 130,000*l*., required in connection with the purchase of the Leeds tramways undertaking.

THE Airdrie Iron Company, engineers and ironfounders, successfully cast at their works yesterday a huge anvil block, 40 tons in weight, for the Portland Forge Company, Kilmarnock. It is expected it will take about a fortnight before the casting is sufficiently cooled down for handling. This is by far the largest casting ever done in Airdrie.

THE expense of widening the new bridge at Dumfries, amounting to 4,300*l*., has been defrayed by Miss M'Kie, of Moat House. The gift, which was announced two years ago, was in the first instance anonymous. Sir William Arrol, who was

engaged as consulting engineer, declined remuneration for his services, and he has been presented by Miss M'Kie with a piece of silver plate.

THE Paddington Vestry have under consideration a recommendation from their sanitary committee to the effect that a lady sanitary inspector be appointed tentatively for one year at a salary of 60*l*.

In the *Glasgow Herald* a London correspondent states, "I understand that Mr. Shaw-Lefevre, who has recently been to Edinburgh, is of opinion that no substantial or serious repairs are necessary at Holyrood Palace, and that therefore there is no need for any special expenditure upon that building. But Mr. A. C. Morton, who has taken considerable interest in the subject, intends, I believe, to suggest that if the Government will not spend money on the Palace to put it in a proper condition, it should be handed over to the Edinburgh Corporation, who will doubtless take a pride in restoring and upholding this interesting historical monument."

THE statuary on the north transept of Westminster Abbey, illustrated in Mr. Burke Downing's article, is the work of Mr. Nathaniel Hitch, sculptor, of Vauxhall.

ELECTRICAL.

BEFORE the old year gave place to the new year, the Philadelphia *Ledger* was able to record the inauguration of the electric light column. The huge wooden casing in front of Wanamaker's, it says, was taken down, and there stood revealed a handsome column of incandescent bulbs, with broad spiral stripes, each of a different colour, white, blue, purple, orange, green, yellow and crimson predominating. The column is about 25 feet high, and from it extend four long arms lined with rows of glass bulbs of different colours, two of the arms in the side aisles terminating in 25 bulbs each, and two in revolving balls of 266 bulbs each, at either end of the Chestnut Street façade, all handsomely coloured. At intervals of a few seconds each stripe flashes with light, one brilliant colour swiftly following another until the top of the column is reached, when the varying light is diffused along each of the arms until the two large bulbs are reached, where the flashing continues until all the colours are shown. Meanwhile the two large balls are kept revolving, and flash continuously with varying lights and colours. The whole affair, whose effect is very pretty, is ingeniously managed by a switchboard in the base-

ment under the column, where a large cylinder, somewhat like that of a music box, is kept revolving by the dynamos of the establishment, the teeth in the cylinder closing and cutting off the circuit as contact is made with or withdrawn from the rows of separate conductors on the sides of the switchboard. As the lights change from one colour to another they go out completely, leaving no lingering glow in the carbons to spoil the effect, as would be the case were it not that this has been guarded against by a current of air being ingeniously injected automatically by the machine.

THE Vienna correspondent of the *Standard* says:—The company which owns all the tramways in the Hungarian capital, having altogether a length of 90 kilometres, or about 56 miles, has resolved to adopt electricity as the motive power over the entire system. The installation, it is computed, will take three years to complete. The total cost of the change will, it is calculated, amount to 10,000,000 florins.

THE Local Government Board have given their sanction to the raising by the Ealing Local Board of a loan of 25,000*l.* for purposes of electric lighting within their district.

It is understood that in Easter week an appeal will be made for funds to introduce the electric light into St. Paul's Cathedral and to complete the work of decoration.

TRADE NOTES.

WE have lately had introduced to our notice by Messrs. Smith & Co., of 45 Oxford Street, Manchester, a new sensitised paper for copying architects and surveyors' plans, to which they have given the name of "Simplex" paper, and for which they are the sole agents. The chief advantage claimed for this paper is that it produces black lines on a white ground with a water bath only, no chemicals of any description being required. This, as can be well understood, is an immense step from the old ferro-prussiate and other kindred processes, and the result obtained allows of the print to be coloured in the same manner as an original drawing. Its extreme simplicity also should bring it within the reach of many architects who are unable at present to copy their own plans, owing to the space and manipulation required for the chemical baths necessary for the other processes giving positive prints. The specimens that we have seen printed from this paper are far superior to the results obtained on any other sensitised paper brought to our notice,

the lines coming out a good black on a perfectly white ground. The price also is no higher than that of the best gallic acid paper. Messrs. Smith & Co. are also makers of the frames and baths, &c., necessary for this and other kindred processes, and also hold a large stock of all accessories for the full equipment of a draughtsman's office, and will forward full particulars of their specialties on application.

ALDERMAN FAWCETT, J.P. for York, has presented a new illuminated turret striking clock to St. Lawrence's Church, York, which was started on New Year's Eve, the same having been made and erected by Messrs. W. Potts & Sons, of Leeds.

THE new Technical Schools, Birmingham, are now being pushed forward, and the matter of heating and ventilation having received a large amount of consideration, the scheme of mechanical ventilation and heating prepared by Messrs. Baird, Thompson & Co. has been selected and the contract placed with them.

THE *Liverpool Courier* says:—The Welsh slate trade shows signs of steady improvement. The large and small quarries are generally working full time, while the demand in many instances is in excess of the supply. The monthly statement submitted to the Carnarvon Harbour Trust yesterday showed that 6,413 tons of slates had been shipped during the month, as against 6,398 tons in the corresponding month last year. During September, October and November 20,687 tons had been shipped, as against 19,924 for the corresponding period last year.

THE *Glasgow Herald* states that a proposal has been made to hand over the Perth Public Swimming Baths, with the whole works connected therewith, free to the Police Commission, for the purpose of being administered and managed by them as the local authority.

THE Albion Clay Company, Limited, Woodville, Burton-on-Trent, and 18 New Bridge Street, London, E.C., have been granted the highest awards for all their exhibits at Chicago. These include the "Sykes's" patent joint-pipes, the patent "Paragon" pipes, and other stoneware. Their exhibit of stoneware pipes, it is claimed, was the most important of the kind in the exhibition. The company manufacture all their pipes from their own stoneware clays (not fire-clay). They are of a hard, impervious body, true in form, and well glazed. They have been proved by severe tests by engineers and also at Kirkaldy's to withstand the highest pressures ever applied to stoneware pipes. Mr. Henry Knowles, the managing director, is the inventor of the patent "Paragon" pipes. He is also the

inventor of the patent direct-action kilns in which all the goods manufactured by the Albion Clay Company, Limited, are burnt. He received the highest award for the patent kilns at the International Inventions Exhibition, London, 1885, and has been granted the highest award, diploma and medal for the kilns at Chicago.

MESSRS. PARSONS & HARRIS, of Sidney Grove, E.C., have recently introduced a heating apparatus, which should achieve a large measure of success. Parsons's "Radiator," as it is called, is available for steam or hot water, and is equally suitable for public or private buildings. Ornamental in design, and occupying about 40 per cent. less space than is usually needed, it is cleanly, as the whole of the heating surface is vertical, which prevents the accumulation of dust; it is self-ventilating, and the heating power can be easily regulated. The steam or hot water, as the case may be, circulates in the internal passages, the heat from which is conducted along the webs of metal and around the external or air passages. The cold air enters at the bottom, where the supply can be regulated by the ordinary air-inlet valve, passes up through the passages heated by conduction, and therefore is not scorched, and emerges through the top grating having a comfortable healthy warmth imparted to it. At the same time the air contained in the apartment is heated by contact with the external surface all over the radiator, also by conduction. This patent radiator heats the incoming air without extracting the moisture and without rendering it parched by direct contact with the bare steam pipe. In short, it is healthy in use, attractive in appearance, and economical in price and in working.

We have received the annual catalogue of the Pullman Sash Balance Company, of Rochester, New York (Mr. Robert Adams, of London, sole agent). It gives full particulars of the Pullman sash balances, Pullman car window balances, Pullman wall-case balances, Pullman show-case balances and Pullman steel spring hinges, with very useful directions of how to fix them. The spring sash balance is adapted for old as well as new work, and can be used in many places where weights and cord cannot be used. It is easily applied, runs noiselessly, and has an attractive appearance, and it is warranted to be practically indestructible.

We are informed that Messrs. Baird Thompson & Co. have some very large contracts on hand at the present moment, but that, with their three works in London, Glasgow and Birmingham they are able to cope with any work placed in their hands for heating and ventilation.

PUBLIC IMPROVEMENTS AT CHARING CROSS.

THE following proposals have been made by Mr. Wm. Woodward, and will be considered at the next meeting of the Society of Architects:—

It will be readily conceded that the Metropolis can well afford to have bestowed on it some of those artistic municipal delights which distinguish continental cities and make the English visitors yearn for a taste of them in their own grand London.

The improvements which have for many years occupied my mind and the minds of all those who have at heart the convenience and beauty of London are many, but at this time I confine myself to works at Charing Cross, which, whilst affording an opportunity for the immediate engagement of hundreds of the unemployed, will, I venture to predict, astonish Londoners by the transformation which will be effected, and lead them to ask why it was not all done years ago.

I will divide the subject into three broad headings:—

1. Improvements at St. Martin's Church.
2. Alterations at and the beautifying of Trafalgar Square.
3. Opening of the Mall of St. James's Park into Charing Cross.

1. It is well known that at the west front of St. Martin's Church the roadway narrows into the neck-of-a-bottle shape and, combined with the almost dangerous and unsightly steps to the portico, renders this busy-with-traffic point exceedingly inconvenient. My proposal is to clear away the whole of the steps to the portico, with the exception of the upper step (which should be left to afford an adequate and apparent support to the columns) and to build under and flush with that upper step what is known in architecture as a "podium" (or wall carrying a portico), similar, in fact, to the wall of the portico at the National Gallery, but not, of course, nearly so high. This wall would be continued north and south so as to enclose the new steps which at the north and south ends would lead up to the western entrance to the church. The wall is designed to harmonise with the architecture of the church, and handsome piers and standards would provide for effective lamps to light the surroundings.

An average width of about 12 feet would thus be thrown into the public roadway and all the inconvenience and unsightly effect of the steps be at the same time removed.

147 STRAND, LONDON, W.C.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in $4\frac{1}{2}$ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

2. It is the mere relation of an acknowledged fact to say that Trafalgar Square is about as woe-begone and miserable an open space as can be imagined for so fine a site.

My proposal is to clear away the awkward and unarchitectural steps at the north-east and north-west corners returning the balustraded wall as shown on the plan. To shift the "Napier" and "Havelock" statues respectively further east and west, so as to form fitting terminations to the east and west extended enclosing walls of the square. To shift the granite posts, which are now too far north in the square, to the edge of the footway proper at the southern side of the open space. To clear away the present basins with their mean and paltry water jets, and, having removed the Gordon statue, as hereafter described, from the centre of the square, to transport the "Shaftesbury" fountain from Piccadilly Circus (where it is acknowledged to be quite out of place), and fix it in the centre of the square—raising it bodily 4 feet on a granite base, and providing a large circular basin into which there would be ample room for the jets to play, and introducing further jets at the upper part of the fountain to afford a more lively and picturesque water display. To take down a portion of the balustraded wall of the northern terrace of the square, immediately opposite the centre of the National Gallery, and to build a grand central staircase thus affording a dignified and handsome approach to the square, and opening up the front of the National Gallery as seen from the south. The enclosing walls of the steps would be terminated, that on the west by the removed statue of Gordon, and that on the east by a new statue, say to Lord Shaftesbury. The piers at the mid-way landing and at the top of the steps would be adorned by lamps and sculptured groups or figures. Then the square, as a whole, extended by the shifting of the granite posts southwards would be laid out as a public garden with perambulating gravel paths 12 feet wide, and ornamented with shrubs, dwarf trees and flowers, and provided with numerous seats. At the north-west angle whence the old steps will have been cleared away, a public lavatory for ladies will be provided, extended under the terrace, and at the north-east angle will be formed a similar lavatory for gentlemen, these taking the place of those removed as hereinafter described from near the statue of Charles I. The one equestrian statue now in the square, that of George IV., would be removed to the triangular space in St. James's Park, opposite Carlton House Terrace. The unsightly raking enclosing walls on the east and

west sides of the square would be improved by being broken up into horizontal lengths, with piers at the breaks, upon which would be placed lamps.

3. By the removal of only six houses at Cockspur Street, from the north-west corner of Spring Gardens, westwards, and a few of the old houses in Spring Gardens—the latter already, I believe, in the possession of the Treasury—one of the finest avenues and vistas would be at once formed. In a line with the Strand, the whole of the Mall, with its row of trees, as far as Buckingham Palace, would be open as a drive to the west, beautiful in itself, and affording great relief to the traffic to Victoria Station and westwards. Just at the commencement of the new avenue I propose to build a grand triumphal arch, 100 feet in total width, and fronting the avenue would be the New Admiralty and War Offices, now in course of erection, and other building sites of great value would be necessarily formed and be available for extension of the London County Council accommodation, or otherwise as the authorities may decide. The statue of Charles I. would be shifted in position so as to look up the new avenue, and the public underground lavatories near it would be transferred to Trafalgar Square, as before stated, and the space be filled up.

The drawings which accompany this outline description show the whole of the proposed scheme. Successive Governments have promised the opening up of the Mall, and the report of the Committee on the new Admiralty and War Offices also distinctly provides for it, the new buildings having also been laid out with that end in view. I now most earnestly entreat the Government, the London County Council, the vicar of St. Martin's and the local authorities to give to the subject their strenuous exertions so as to secure the immediate start of the works, thus affording employment to many of the unemployed, and effecting grand, useful and beautiful improvements worthy of this rich and magnificent metropolis.

So far as my personal share in the matter is concerned, I may be pardoned for stating that with the exception of the opening of the Mall and the Triumphal Arch—plans for which were some years ago prepared by the architect, Mr. John Robinson, in conjunction with me, and published by the Royal Institute of British Architects—the whole of the designs belong to me as their sole author; but I am, nevertheless, quite prepared to hand them over, free of charge, to any authority deputed to carry them out, or I shall be willing to undertake myself the usual architectural supervision and preparation of the necessary detail drawings and specifications.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

• **Two Independent Scientific Opinions:—**

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

THE DESTRUCTION OF BABEL: THE SCATTERING OF THE PEOPLE.

RICHMOND HOSPITAL.

THE Richmond Town Council have, after a good deal of difficulty, settled the long-standing hospital question. They have entered into an agreement with the Heston and Isleworth Local Board to purchase for 3,000*l.* 17 acres of land at the southern corner of Hounslow Heath, separated from the heath by the Windsor line of the London and South-Western Railway, and here the two authorities will construct a hospital at a cost of 6,000*l.* The existing hospital of the Heston and Isleworth Local Board at Dodswell is to be taken over by both authorities, and retained as a small-pox hospital. The costs, with some exceptions, are to be apportioned on the rateable values of the two districts. The hospitals will be about four miles from Richmond. The Town Council will not now need to proceed with the application for compulsory powers to obtain the Fern Hill site.

THE CONNAUGHT DURBAR HALL.

A RECENT number of the *Bombay Gazette* says:—Lord Harris at the invitation of the Chiefs of Kathiawar has just performed an interesting ceremonial at Rajkot. The occasion was the opening of a fine building, erected by the contributions of the chiefs to commemorate the presence in Kathiawar of H.R.H. the Duke of Connaught, while Commander-in-Chief of the Presidential Army—an historical institution which will require in a week or two a memorial to show that it had once existed—and the services of two other British officers well known and beloved in the Province. The Connaught Durbar Hall occupies the centre of the building, which, with a museum commemorative of Colonel Watson, and a library, bearing the name of Colonel Lang, will be known as the Memorial Institute. The Institute was originally intended to commemorate the Jubilee of the Queen-Empress, in honour of which the chiefs subscribed a sum of nearly two lacs to be expended on a durbar hall and a museum. The urgent need of a supply of pure water

for Rajkot induced the chiefs to consent to the money being laid out on the construction of waterworks, which bear the name of the Victoria Jubilee. This new project was successfully carried out, and the works were formally opened by the Political Agent, Sir Charles Ollivant, last year. The first proposal was, however, received in an improved form at the suggestion of Sir Charles. The chiefs and the Kathiawar public subscribed a considerable sum to erect a museum as a memorial to Colonel Watson, who died in 1889, after being connected with the Province for twenty-five years, during which he identified himself with its prosperity and progress, and made himself greatly beloved. It was suggested that the money available should be supplemented by further contributions to erect a memorial institute on a scale sufficient to fulfil several purposes. It was decided to erect a building, combining under the same roof a durbar hall, a museum and a public library, of which the Lang Library, which was very inadequately housed, should be the nucleus. The work has been accomplished by the united efforts of the chiefs themselves. A capacious and stately durbar is, of course, required for public ceremonials, which the chiefs of the Province attend together in pomp from time to time for the reception of the princes of the blood and other distinguished visitors, for investitures, and the like. Such a hall of audience has been designed and erected by Mr. R. B. Booth, C.E., and Agency engineer. The structure forms an imposing *ensemble* in cut stone, standing in a beautiful garden, which is in many respects an admirable adjunct to the museum, for many beautiful stone carvings rescued from destruction in various outlying parts of the Province have been effectively displayed about the grounds, where they are protected from risk of destruction or injury.

The function at which Lord Harris assisted on Friday last was brilliant and imposing. All the principal chiefs were present with their picturesque following. The popular Maharajah of Bhownugger, on behalf of all the chiefs of Kathiawar, in an appropriate and graceful speech, requested his Excellency to open the building. The Institute, his Highness justly said, perpetuates the kindly recollections which Kathiawar retains of the Duke of Connaught and the two other distinguished British officers, who had lived and died amongst them. The Connaught Durbar Hall proves to be admirably adapted for its special purpose, and forms an appropriate setting for pomp and pageantry. Sicilian marble has an effective part in the decoration of the floor, but the structure as a whole is built of the excellent sandstone, for which

Kathiawar is famous. The quarries of Vankaner, which supplied this particular stone, are only twenty-five miles from Rajkot. The abundance of the excellent raw material which lends itself to the skilful chisels of the Rajkot artisans, famous as stonemasons and carpenters, has enabled Mr. Booth to erect the building at less than half the cost a similar structure in Bombay would have involved. The marbles from Italy, which are to be seen in the handsome mosaic of the floor and the white steps by which the dais is approached, were imported in preference to utilising the Kathiawar marbles, because it is more economical to work the finer-grained marble than the coarser and harder blocks of the country. There is, however, a future for the Kathiawar marbles; it will not be the fault of the Rajkot masons if they are not more fully utilised, for they are indefatigable in experimenting with them. The most interesting collections in the museum are the samples of building-stone and marble from the different States. Porebunder stone, to which every building in Bombay owes so much of its lightness and nearly all its carvings, is to be found over three-fourths of Kathiawar. The convenience of shipment at the port of Porebunder has induced importers to bring stones from the quarries in that immediate neighbourhood; but excellent white sandstone of similar quality is to be found in many other localities. The handsome Porebunder pillars supporting the large galleries of the Watson Museum come from Vankaner. Junagadh and Jamnagar display many fine specimens of marble as does also Gondal with limestone and sandstone. A fine model of the Memorial Institute has been sent to the museum from the State of Dhrangadhra. The Durbar Hall, the museum and the library are each carved out of a solid block of sandstone, every detail being accurately reproduced. The bandstand, in carved stone, one of the most conspicuous ornaments of the institute gardens, has been carved by the workmen of the country from a sketch of one of the oldest examples of Hindoo work in Kathiawar. Innumerable figures which in the original were nude and therefore inappropriate, have been replaced by the inventiveness of each individual mason, who sketched out in pencil athletes, soldiers, British sportsmen gun in hand, English ladies going to church with their prayer-books in infinite variety, and a naive confidence in Ruskin's principles that decorative architecture owes everything to the initiative of the individual workman. This unique bandstand is the gift of the Thakore Saheb of Gondal. The most effective features of the garden, created out of a most un-

promising river-bed, are the trophies of ancient Hindu architecture, dug out from mounds of rubbish in different parts of the Province. Five elephants fighting show that two thousand years ago the Hindu sculptor knew very well how to put vigour and life into his work. The Thakore Saheb of Limbdi has enabled the Agency engineer to construct a very picturesque conservatory, the entrance to which is composed of carvings rescued from the *débris* of famous temples ruined eight hundred years ago by the first Mahomedan conqueror who visited India. How long the buildings had stood before Mahomed of Ghazni appeared on the scene it is impossible to say. The Watson Museum and the institute gardens will prove of the greatest assistance to archæological investigation by preserving in a conveniently central position valuable fragments of old sculptures and rare inscriptions, which were perishing from neglect and ill-usage in the wilder parts of the country.

One of the most honourable characteristics of the Chiefs of Kathiawar who have combined to erect the Memorial Institute is the generous emulation with which they contribute adjuncts that enhance the usefulness and attractiveness of the Institute. Mr. Frank Brooks, having made drawings from the life of Kathiawar lions, the Nawab Saheb of Junagadh is defraying the cost of having a pair of Gir lions sculptured and placed at the entrance of the museum. Mr. Brooks's palette has been utilised in the portraits of the twenty-eight princes which adorn the Durbar Hall. He has also painted admirable likenesses of Lord Harris, Sir Charles Ollivant, Colonel Hancock, the acting political agent. The portrait of Mr. Booth rightly finds its place on the walls of the building which he designed and erected with so much talent. Over the dais are three royal portraits, for which the chiefs specially subscribed. The centre shows a full-length representation of Her Majesty by Macbeth Raeburn, after the famous presentment of the Queen by Angeli. On the right is the full-length portrait of the late Duke of Clarence, who visited Kathiawar during his tour in India—the artist is Mr. A. Soord. On the left is a portrait of the Duke of Connaught by Mr. C. L. Burns. The Lang Library, which commemorates Colonel W. Lang, contains several interesting portraits. That officer was Political Agent from 1846 to 1859, when Kathiawar was so little advanced that it was due to his private liberality that the first girls' school was established in the Province. He was an administrator of a type now almost extinct, working according to his view of the necessities of the case, and troubling himself little about rules and regulations. He was suited to the time and the people and did excellent work in his day

and generation. His memory was commemorated by the establishment of the first library ever established in Kathiawar. His portrait hangs on the wall of the new library, as does also the portrait of the first Political Resident in Kathiawar. The commemorative tablet of the gallant young Lieutenant Gordon and the sowers who perished with him when breaking up a band of dacoits a year since will find a suitable place in a panel of the library wall. The library will fulfil another function. The ladies of the station will be admitted to a sub-division of the library set apart for reading and conversation. Thus the Memorial Institute at Rajkot will combine with its other civilising and formative agencies some of that social charm which the Royal Bombay Yacht Club has known how to associate with the advancement of yachting and the diffusion of a taste for nautical adventure.

ARBITRATION CASE.

THE case of *Nightingale v. Sir C. Nicholson* and others (the London, Liverpool and Globe Insurance Company) has been opened before Mr. P. E. Pilditch, sole arbitrator, at the Surveyors' Institution. The claim is for a considerable sum, and is made by the builder, who reinstated a large block of warehouses at Rotherhithe, against the insurance company, who undertook the reinstatement. Our readers will remember that the disastrous fire in question has already formed the subject of an action at law between the owner of the warehouse and the insurance company. For the plaintiff, the builder, appeared Mr. F. R. G. Radcliffe, instructed by Messrs. Mackrell, Maton & Godlee, and for the insurance company, Mr. Dickens, Q.C., with whom was Mr. Cecil Chapman, instructed by Messrs. Lee & Pemberton. The following professional gentlemen gave evidence on behalf of the plaintiff; Mr. Alexander Stenning, district surveyor for Rotherhithe (who appeared on subpoena), and Mr. Perry, of the firm of Messrs. Perry & Reed, architects. The case, in which a number of interesting points have been raised, is expected to last several days longer, and the hearing was adjourned until the 16th and 17th proximo.

BRITISH AND GERMAN IRON MANUFACTURE.

THE American Consul-General at Frankfort in a recent report describes the results of German economy in iron manufacture. After examining the statistics of British and German production

of finished iron and steel between 1880 and 1892, he comes to the conclusion that, while in this period Great Britain shows an increase in production of only 70 per cent., the German increase has been 400 per cent. This latter increase has gone on in spite of the increasing cost of coal in Germany, due to the higher wages demanded by miners and the greater consumption in the face of a definitely limited supply. The Consul-General attributes this result to two causes—first, the introduction of the basic process, which enables the ironmasters of Westphalia, Silesia, and the Saarbruck district to use their cheap and abundant native ores; and, secondly, the unrivalled chemical skill of the Germans, by which they have succeeded in saving the by-products of coke manufacture, thus deriving a revenue from a process which in other countries entails a waste of material and a financial loss.

THE LONDON WATER SUPPLY.

AMONG the Bills which will be introduced next session into Parliament by the London County Council will be one "to empower them by agreement to purchase or take on lease and hold lands and water rights." The following is the text:—

"Whereas, under the London Water Act, 1892, the London County Council have power to introduce Bills relating to the supply of water in the administrative County of London and within the limits of supply of the metropolitan water companies; and whereas some of the areas in Great Britain best adapted for sources of water supply have been already appropriated under the authority of Parliament by the municipal authorities of the principal cities and towns, and powers for the appropriation of further areas have been from time to time granted, and are from time to time applied for on behalf of other populous and increasing places; and whereas it appears that the means for the supply of water to London and the neighbourhood are inadequate, and that larger quantities of water than can now be legally obtained are required for that supply, and that, if the rivers Thames and Lea are to be relied upon for the future water supply of London, considerable additions are necessary to the arrangements for storage, filtration and purification; and whereas it is estimated, in view of the probable increase in the population of London and the neighbourhood, that the existing sources of supply might at no distant period

become inadequate, while the increasing population in the valleys of those rivers will render it increasingly difficult to maintain their water sufficiently pure and wholesome for drinking purposes; and whereas it is expedient that powers should be conferred on the Council under which, as occasion may offer, the Council may have power to purchase land and water rights which they may think it desirable to secure with a view to the future supply of water for London and the neighbourhood; be it therefore enacted as follows:—

"Clause I.—This Act may be cited as 'The London County Council (Water) Act, 1894.'

"Clause II.—It shall be lawful for the Council to purchase by agreement or take on lease:—

"(1) Any lands, houses and buildings or easements; and

"(2) Any waterworks, wells, waters, or rights to take or convey water

which the Council may think it desirable to purchase or take on lease with a view to the future supply of water to London and the neighbourhood.

"Clause III.—It shall be lawful for the Council to hold and manage any such lands, and from time to time to let such lands, works, or rights, or any of them on lease or otherwise, and to sell or exchange any of such lands."

A Bill has been deposited by the West Middlesex Waterworks Company at the Private Bill Office of the House of Commons to enable them to raise additional capital to the extent of 500,000*l.* in view of the increasing requirements of the company's district and the large expenditure which they are about to incur in providing new reservoirs. A Bill has also been deposited by the Southwark and Vauxhall Water Company asking power to make a service reservoir, situated partly in the parish of St. Giles, Camberwell, and partly in the parish of Lewisham, a storage reservoir in the parishes of Hampton and Sunbury, and a subsiding reservoir in the parish of Hampton, with the necessary works relating thereto. In regard to these works the company seek to stop up the private footpath leading from the Lower Sunbury Road to the River Thames. In addition to the daily quantity of 24,500,000 gallons which the company are authorised to take from the Thames, they ask power to take such further water as they may require, provided that, if similar action is taken by the metropolitan water companies, the daily flow over Teddington Weir shall not be reduced below 200,000,000 gallons. For the purposes of the Bill the company ask power to raise 750,000*l.* additional capital.

RAILWAY COMPANIES AND THE BUILDING ACT.

A DECISION was recently given by Mr. H. J. Bushby at the Worship Street Police-court, in a case which had been argued before him on a previous occasion.

A summons was taken out against Messrs. Kirk & Randall, contractors, by Mr. Henry Lovegrove, district surveyor of South Islington and Shoreditch, in each of the following cases. A building had been erected at the cost of the London and North-Western Railway Company in Maria Street, Shoreditch, for the purposes of storing fodder for Messrs. Allsopp & Co. The contractors were instructed by the railway company not to give notice and not to pay the fees. The building was completed while the parties were discussing the matter, and the summons was therefore for fees instead of neglect to give notice. Another building to be used by Messrs. Cameron & Co., coal merchants, had been erected under similar conditions. The magistrate having cited the various cases, gave judgment for the district surveyor, with costs in each case.

As this is a very important matter, a case will be stated for the decision of the Queen's Bench Divisional Court.

THE STOCKPORT SEWAGE WORKS CONTRACT.

AT a special meeting of the Stockport Town Council held to consider a recommendation of the sewage outfall committee that the tender of Messrs. T. & W. Meadows, of Heaton Norris, should be accepted for the construction of the first section of the main intercepting sewer which is to take the sewage of the borough to works of filtration about to be constructed at Cheadle Heath, and so help to purify the river Mersey, one of the feeders of the Manchester Ship Canal. The amount of the tender is 33,500*l.* Eleven other tenders had been sent in, one of them from Mr. Peter Smith, of Manchester being 31,064*l.* 9*s.* 9½*d.* In explaining why the lowest tender had not been accepted, Alderman W. Lees said that no member of the committee knew anything of the person who sent in the lowest tender.—Several members of the Council expressed surprise that Mr. Fowler, engineer for the sewage scheme, had not been able to give the committee information on the point.—Councillor J. Williamson said that Mr. Smith had tendered previously for works of bridge building in the borough and other work, had worked on the Salford great sewer, of which Mr. Fowler was engineer, and had with a partner constructed the Deansgate portion of the Manchester

sewer for a distance of $4\frac{1}{2}$ miles.—On the other side, members doubted if Mr. Smith had carried out the works in question as principal, and after a lengthy and warm discussion an amendment was carried by a large majority ordering inquiry to be made as to the works previously carried out by Mr. Smith, and as to other matters bearing upon the contract. The inquiries having resulted satisfactorily, Mr. Smith's tender is recommended for acceptance.

DECAY OF STONE IN ARBROATH.

At the last meeting of the Arbroath Natural History Society the Rev. James Thomson gave the opening address. In it he spoke about the durability of stone used for building and monumental purposes. Much ignorance, he said, prevailed on this subject. Some of our finest structures in Arbroath, like the Royal and Commercial Banks, of recent erection, had already suffered marked decay. A careful examination of the state of preservation of the stone in buildings of known age should be made and tabulated, and a list, showing the rate at which each kind decays, and the quarry from which it was taken, would be of immense advantage to architects and builders. A large number of beautiful marble monuments had recently been erected in their cemetery. When first set up the snowy whiteness of the stone made them the most attractive memorials of the dead. But what of their durability? A little observation showed that marble slabs soon became darker in hue. Those set up not more than twelve years ago were distinctly weather-worn and greyish in colour. Let anyone saunter through the Abbey burying-ground, and they would find that marble slabs, dating from the middle of this century, were hardly legible. Those over fifty years of age were in an advanced state of decay. The oldest he had noticed, built into the south wall of the choir, was sadly rent and dilapidated. Yet it only dated from 1817. A white marble statue of the Queen in Aberdeen, after fifteen years' exposure, had been removed to the hall of the Town House, as it was in danger of going to pieces. The strikingly beautiful Virgin Martyrs' monument at Stirling had to be protected by a glass dome. Marble is very porous, and the pores by absorbing water, which expands by frost, lead to the rapid break up of its crystalline parts. Then the merest touch causes them to crumble into loose sand. Besides frost, the disintegration of marble is largely due to the action of carbonic acid in the pervading rain water, whereby the component granules are dissolved. The rate

of decay is somewhat more rapid in towns where there is an excess of carbonic acid in the smoky atmosphere. Mr. Thomson said he never visited their fine cemetery without being vexed at seeing the rapidly increasing number of beautiful monuments in marble—memorials the purest and the chastest that love and art could furnish—because he knew that however exquisitely graceful they were now in their lustrous whiteness—instead of being the enduring mementoes they are meant to be, the time was not far distant when those very stones would become monuments of decay. He strongly recommended their removal to the interior of churches, where they would remain things of beauty for untold centuries. He next touched on the weather-resisting qualities of sandstone, pointing out that as a general rule grey varieties stood better than the red.

TRADE IN ABERDEEN.

IN many branches of industry, says the *Scotsman*, Aberdeen has enjoyed a large amount of prosperity during the past year. In the building trade, for example, remarkable activity has been manifested, and, with a rapidly-growing population, the extension of the city in all directions has been proceeding at a marvellously accelerated pace. The erection of 184 new dwelling-houses was sanctioned at an estimated cost of 126,855*l.*; there were 34 alterations and additions to existing houses, at a cost of 6,418*l.*; 11 public buildings, including schools, costing 116,500*l.*; 54 new business premises, valued at 11,608*l.*; and 68 additions and alterations on business premises, costing 32,098*l.*—a total of 351, and value of 293,479*l.* In the previous year the number of new buildings was 228, and the cost 186,000*l.* These figures show an increase of 123 in the number of dwellings, and an increase in cost of 107,479*l.* Among the public buildings in progress or completed were the important Marischal College extensions, a new hospital for the Royal Lunatic Asylum, the Salvation Army Citadel in Castle Street, extensive additions to the City Epidemic Hospital, new police offices in Lodge Walk, offices for the Canadian Mortgage Company at the corner of Crown Street, a new block at the Royal Infirmary, head offices in Guild Street for the Great North of Scotland Railway Company, the Grand Hotel in Union Terrace, additions to the Incorporated Trades Hall, churches for the Free Holborn and Baptist congregations, a new public school at Broomhill, and others. The granite industry, of course one of the staple

employments in the "Granite City," has fluctuated considerably. The export trade has become very much restricted during the last three months, and complaints are heard of the unremunerative prices, mainly on account of financial troubles in America and the colonies. On the whole, however, the home stone-cutting and monumental trade has been fairly good, and as some large commissions are in hand it is hoped that the temporary dullness will not be severely felt. Messrs. Alexander Macdonald & Co., the old-established granite workers, report a fairly busy twelvemonth, and that the output from the quarries was much the same as last year. Some fine columns and pilasters for interior and exterior decoration were sent to England, and a large number of red granite columns were executed for a new Roman Catholic Cathedral in Melbourne. Among other commissions they have done work for Her Majesty the Queen, and carved numerous Celtic crosses, one of the latter having recently been erected in Paisley Cemetery to the memory of the late Mr. Barbour, M.P., while a drinking and monumental fountain was executed for Accrington. The commissions in hand include a pedestal for a statue (by Onslow Ford, R.A.) of the late Sir William Pearce, Bart., to be erected at Govan; a monument for the late Mr. Allan, of the Allan Line of steamers, and polished granite in columns, &c., for a new church at Omagh, Ireland. A memorial cross of Rubislaw granite, standing 18 feet high, and of carved Celtic design, has just been completed for a Clackmannanshire gentleman. Mr. Fyfe, of Kemnay's quarries, have also been kept very busy on account of the abundance of building jobs. Mr. Fyfe's contracts include the building of the Rutherglen Bridge over the Clyde, the viaduct in connection with the diversion of the North-Eastern Railway at Newcastle-on-Tyne, the viaduct at Bonar Bridge, the new Tower Bridge over the Thames and the works in connection with the Aviemore line. Messrs. A. & F. Manu-eile have had large demands upon their material, and Messrs. J. Wright & Sons have also had a very good year and have secured a number of contracts for granite fronts of buildings, among these being a polished frontage for the Equitable Assurance buildings in Manchester; for London and Welsh buildings in both red and grey granite; a front in the same material for a Dublin hotel and massive columns for Philadelphia. The Great North of Scotland Granite Company were busy with the frontage to three streets for the Oxford Street branch of the London and Westminster Bank, but otherwise work is reported dull. Where firms have experienced depression it is set down

to foreign competition and to the falling off in the American trade during the last few months. In granite paving setts there appears to be a downward tendency.

THE ARBITRATION CLAUSE IN AUSTRALIA.

IN Melbourne, before the Chief Justice, Mr. Justice Williams and Mr. Justice Hood, the Victorian Railway Commissioners moved to set aside an arbitration award given in favour of Messrs. Bloomfield Brothers, of Melbourne, in connection with their contract for the construction of a portion of the Camperdown to Terang and Warrnambool railway. The contract was entered into in the year 1887, and at the conclusion of the work, the Messrs. Bloomfield claimed a sum of 28,500*l.* for various extras and contingencies over and above the items allowed by the engineer-in-chief. The contractors demanded that the matter should be submitted to arbitration in the manner provided in the contract, and the department under protest nominated two out of the three arbitrators, intimating at the same time that if an award were made against it steps would be taken to have it set aside on the ground of illegality. The arbitrators were Messrs. E. G. Snowden, J. Reid and L. P. Maline, and after a prolonged investigation they awarded the Messrs. Bloomfield a total sum of 7,811*l.*, comprising a number of items which were set out in the award. The present motion to set aside the award was based on the grounds, among others, that the arbitrators exceeded their authority, as none of the claims contained in the request for arbitration were matters referable to arbitration; that the arbitrators were wrong in deciding that sleepers were "permanent-way material," and in finding, contrary to the engineer-in-chief's certificate, that matters which the engineer-in-chief had decided were contemplated or provided for in the contract were not such matters; that the finding by the engineer-in-chief that the several items were contemplated and provided for in the contract was conclusive, and could not be impeached except for fraud; that the arbitrators wrongly treated certain claims as claims for loss occasioned by the Department failing to provide permanent-way material; and generally, that the award as a whole was a nullity.

The Chief Justice, in delivering the judgment of the Court, said that in the case of this award the arbitrators had specified the items making up the award, so that it was possible to deal with them separately. The items were divisible into two

All Brass ..	8 <i>s.</i>
Brass Wheel, Iron Fittings 7 <i>s.</i> 6 <i>d.</i>	

This thoroughly efficient Screw Adjustment provides for opening, closing, and securely fastening Fanlights, Casements, &c., and will by its extreme simplicity commend itself to Architects, Builders, &c.

groups. In regard to the first group, the arbitrators found that they had jurisdiction to entertain them, as being claims respecting "extras, additions, enlargements, deviations, alterations or substitutions executed by the contractor, which in the opinion of the engineer-in-chief are not contemplated or provided for in the contract." Their finding on that point was at direct variance with the engineer-in-chief's own statement and certificate, which asserted that he had already dealt with them, and that in his opinion they were contemplated or provided for in the contract, and therefore not referable. Under Clause 87 of the contract, that opinion so expressed by the engineer-in-chief was an absolute prohibition of any appeal to arbitration on those items. It was contended, however, that if it could be shown that the engineer-in-chief could not properly have entertained such an opinion, the items could be treated as coming within the terms of clause 87. The Court was of opinion that this view could not be sustained. It was said that if the engineer-in-chief expressed an opinion one way it might be shown that his real opinion must have been the other way. That raised a very difficult question, but it was not necessary to decide it at present, because it seemed clear enough in this case that the engineer-in-chief had expressed his opinion, and there was no evidence at all sufficient to warrant the conclusion that this was not his opinion. The Court thought, therefore, that the arbitrators could not give themselves jurisdiction by finding specially what they had found under the circumstances of this case and the items depending on that point would be disallowed. The remaining items depended on another matter. Under the contract the Commissioners undertook to provide half the sleepers required, and after the contract was commenced they decided not to do so. This involved delay, and among other things compelled the contractors to incur haulage expenses to a greater extent than would otherwise have been the case. It was therefore said that the contractors had a claim against the department for loss occasioned by its failure to provide permanent way material, in which case the matter was properly referable to arbitration. As against this it was urged first that sleepers were not permanent-way material. If the sleepers might be permanent-way material, the arbitrators would have jurisdiction to decide whether they were so in fact. The Court considered that it was open to the arbitrators to consider that point, and having decided that under this contract sleepers were permanent-way material, they had jurisdiction to go on. The further argument that this item was covered by the general claim for haulage, which was not referable as such, appeared

also to be untenable. The result was that as to the items under this head the arbitrators had jurisdiction, and could then go as far as they liked. The law was that when parties chose to submit their disputes to a domestic forum, comprised of men of common sense, or in other words of men who had no special training for the work, once the arbitrators had jurisdiction they could go to any length. These items would therefore be allowed, and the award stood as to them. As the Commissioners had failed as to part, and that by far the greater part, of the award, there would be no order as to costs.

The items allowed amount to 6,388 $\frac{1}{2}$., and those disallowed to 1,423 $\frac{1}{2}$.. Of the expenses of the arbitration, two-thirds are borne by the department and one-third by the contractors. The total amount of these expenses was not stated, but the fees of the arbitrators alone were 1,500 $\frac{1}{2}$..

BUILDING IN EDINBURGH.

THE past year has witnessed no remarkable development of the Edinburgh building trade, says the *Glasgow Herald*, nor, on the other hand, has any evidence of decline on the average of the previous few years been noticeable. In one respect—namely, the construction of large public buildings—there has been a falling off. The McEwan Hall is still unfinished and the Observatory on Blackford Hill will not be completed for a considerable time, but these are the only two really important works of the kind in the city. The approaching year, however, may see some welcome additions. The Town Council have for a long time past been considering the project of a new fever hospital, for which an estimated cost of 40,000 $\frac{1}{2}$.. has been made, while, as is well known, the managers of the Royal Infirmary have decided on an extension, for which only the funds are needed. The city improvement scheme, too, which has been promoted in Parliament, will doubtless operate with considerable benefit to the building community. In connection with this municipal plan for dealing with slum localities, attention may be directed to the private endeavour, in which Professor Geddes has taken a leading part, to provide model dwellings in a prominent quarter of the city. The site chosen is at the north-eastern corner of the Castle Esplanade, from which a magnificent view is commanded, and here a fine building is in course of completion which internally is all that science and sanitation could demand. During the year, too, some of the old rookeries in the Lawnmarket have disappeared to give place to dwellings with a somewhat quaint and old-world exterior, but quite up to

modern requirements within. If construction on a large scale has not been remarkable in 1893, there has been more than the average number of additions to the housing accommodation of the city. Encroachments on the pleasant country lying to the south have gone steadily on, and especially in the Morningside and Newington suburbs. The returns of the Dean of Guild Court show that during the year new dwelling-houses have been erected at the rate, roughly speaking, of forty-three per month, provision having thus been made for an increase in population of about 2,500. The average in 1892 was thirty-eight per month. A year remarkable for strikes has not passed without a local dispute between the masons and their employers; but probably the most unfortunate result of this dispute was not the influence it had on wages, but the abandonment by the masters of the conciliation board which had been established. In 1892 the standard rate was 8½d. per hour; this year it was reduced to 8¼d., but the reduction has not been universally adopted, and the standard of pay has practically been that of the previous year. Plasterers have had steady employment at 8d., a figure, however, which in occasional times of briskness has risen to 9d.; while the joiners' standard of 7½d. has remained unchanged, plumbers' wages having remained at a farthing less. In the early part of the year signs of a rupture between house painters and decorators and their masters were visible, but fortunately the dispute did not reach serious dimensions, and in the busy season which ensued the men were content to accept the standard of 7½d. prevailing in the trade. The report of Mr. Dowell, auctioneer, on the Edinburgh property market for 1893 states that at his premises "there has been a fair amount of business done in property at 18 George Street during 1893. There was 10 per cent. less city property exposed, and 25 per cent. more sold, compared with 1892. In landed estates there were fifty-three exposed, aggregating 919,200l., of which sixteen were sold, realising 218,042l., with only an increase of 4,692l. above the upsets. The advertised property in the market is rather less than at this period last year; there are fewer first-class mansions, but still a superabundance of tenements; the prices asked for which in some cases are not such as are likely to induce competition. Well-secured feu duties are always in demand, and have maintained their price, the average for the year being 25½ years' purchase. As a result of the financial crisis in Australia and America, we may expect home heritages to return to favour as investments. On the whole there is more hopeful feeling."

BUILDING IN LEEDS.

DURING the earlier part of the past year, says the *Leeds Mercury*, the building trade was in a fairly active state. In anticipation of the coal dispute, however, business dropped off and, in common with other trades, while it lasted the industry became completely paralysed. The manufacture of bricks and other building materials requiring fuel was almost suspended, and there is no doubt that it will take a considerable time for the trade to recover from the effects of this disastrous industrial struggle. Wages during the year have not undergone any alteration, and it is pleasing to note that there has been no labour dispute of any description. There have not been many public buildings undertaken and completed, but the following may be taken as a fair sample of those in course of erection:—St. Chad's Home for Waifs and Strays at Headingley; Yorkshire Penny Bank in Infirmary Street; and the new post-office, in the latter of which much better progress has been made than what was shown in the earlier stages of the work; and the Yorkshire College extensions, which are nearing completion, will no doubt be opened in the coming spring. The splendid pile of offices for the Prudential Assurance Company in Park Row have been opened during the year, and fine shop premises and offices have been erected at the corner of Park Row for Messrs. Peacock, carpet, &c., merchants. In connection with the insurance world we might also mention the new offices being erected in East Parade for the British Law Fire office from the designs of Messrs. Ambler & Bowman, architects; also the large extensions and alterations that are taking place for the Sun Fire office in the premises at present occupied by the Atlas and Lancashire Insurance Companies in Park Row. The Cavalry Barracks in Chapeltown Road are at present in the hands of the builders. New officers' quarters are being erected and the old barracks entirely reconstructed. Two new Board schools are in course of construction, one in Darley Street and the other in Hunslet Lane. In Albion Street the Co-operative Society are putting up a fine pile of buildings on the opposite side of the street to the present premises. St. Aidan's new church, in Roundhay Road, is making headway; a new chapel is being erected in Meanwood Road, and also one in Clark Lane. The Midland Railway Company have erected new waggon sheds at Stourton, and the North-Eastern Railway Company have built new stables at the

top of Railway Street, Marsh Lane. The avenues in the fruit market have been roofed over, and the fish market has been extended. A small-pox hospital and sanatorium have been built at Manston, and the Canon Jackson memorial wing is being added to Cookridge Convalescent Home. In addition to these public works a very large amount of residential property has been put up on the outskirts of the city, chiefly suitable for the artisan class, which appears to let very quickly. Very few expensive residences, or the better class of villa houses, have been erected, although mention might be made of those on the Newton Park Estate for Mr. Lupton, also in Wesley Road, Armley, and on the Cowper Estate in Chapel-town Road and at Roundhay and adjoining Roundhay Road. In reference to the coming year, we are afraid there will be a considerable falling-off in building operations, as the price of materials, owing to the excessive cost of fuel, will preclude to a large extent speculative work being carried on with much prospect of an adequate return for the outlay. New baths are about to be erected for the Corporation in Kirkstall Road and on the side of the old "Midden," near the Covered Market, and it is likely that a large fever hospital will be erected on the Manston estate. We presume the Hunslet railway scheme will go on almost immediately, and this, with the North-Eastern Railway extensions, also the extension of the tramways into other districts, will no doubt greatly influence building operations in the future.

PUBLIC WORKS IN MANCHESTER.

MANCHESTER to-day, says the *Manchester Guardian* of the 1st inst., will be a city of one idea. She will open her gates for the first time to welcome a ship from over sea, and her citizens can scarcely be expected, for this day at least, to think of anything else but the wonderful transformation which has given an inland town a place in the list of English seaports. The magnitude of the achievement throws into comparative shadow several other schemes of civic enterprise which had they stood alone would in themselves have marked the year 1894 as an epoch in municipal history. It may be well therefore at this season to emphasise their importance, lest our neighbours and visitors should receive the impression that the energies of Manchester have been solely concentrated upon one colossal effort. Those who doubt the recent activity of the Corporation in public works have only to refer to the eloquent testimony of

pounds, shillings and pence to be startled into immediate conviction. Selecting five great schemes either just completed or on the verge of realisation, we find ourselves faced by a total expenditure of nearly four millions. Of this amount the Thirlmere water scheme alone, so far as it has gone, claims five-eighths. The drainage system of the city has been remodelled at a cost of 600,000*l.*; rather more than 500,000*l.* has been, or will be, spent on extensions in the different gasworks; the municipal electric-light installation is responsible for an expenditure which will soon reach 150,000*l.*, and the project of supplying hydraulic power to firms within the city means an outlay of 100,000*l.* None of these is an insignificant undertaking, but that which relates to the water-supply is of pre-eminent importance. The day which sees the city supplied for the first time with water from distant Thirlmere will be only less notable in the municipal calendar than the 1st of January, 1894.

Within the next six months our water-supply will have been placed upon an inexhaustible basis. As the community has grown we have had to go further and further afield to secure an ample provision of this prime necessity of life, but we may now rest assured that our foraging days are done. Three hundred years ago Manchester had no occasion to stir abroad for water. The inhabitants derived their chief supply from a well in Fountain Street, and our ancestors filled their pails at a public conduit the site of which is now covered by the Royal Exchange. The conduit was fed by stone pipes from Fountain Street, from the Shudehill pits, and from the ponds near the site of the present Royal Infirmary. At a later period the town brought its water from Gorton and from the canal at Peak Forest, supplementing the supply with water pumped from the unpolluted Medlock. Eventually the Corporation seized upon Longdendale, dammed up the river Etherow into reservoirs, submerged a village or two, and rested. In 1885 Manchester and the district were satisfied with 8,000,000 gallons per day. With a population of a million within the area of supply, we now require a daily delivery of 24,000,000 gallons. Longdendale has never failed us so long as there has been an average rainfall, but in periods of drought the city has again and again been thrown into a state of mild panic at the prospect of a water famine. Thirlmere will save us from all such apprehensions in future. The proud place which the district holds in the rainfall returns commends it to the water-works engineer if not to the tourist. At Longdendale the average yearly rainfall is a mere 50 inches. Thirlmere doubles that quantity, and adds 4 inches to the bargain. There are no

THE

GRINNELL AUTOMATIC SPRINKLER

And the Great Fire in Old Bailey.

LETTER FROM "THE TIMES."

"CASSELL & COMPANY (Limited) write to us, under date November 16, as follows:—'Will you kindly allow us to state that the fire which took place in Fleet Lane last night, and by which a portion of our premises was damaged, will not in any way interfere with the punctual issue of our magazines, periodicals and books? All our monthly magazines for December will be issued at the usual date, and our weekly periodicals, *Cassell's Saturday Journal*, *Chums*, and *Cottage Gardening*, at the ordinary time next week. This week's issue of *Work* and of the *Speaker* may be an hour or two late; but full editions have been prepared, and will be obtainable in the ordinary course. We should like to add, for the information of your readers in general, and of those interested in insurance matters in particular, that the system known as GRINNELL'S AUTOMATIC SPRINKLERS, which we adopted some years ago as a protection against fire, acted admirably on this the first occasion on which it has been practically tested, and undoubtedly did much to save our buildings from serious damage by fire.'

DOWSON, TAYLOR & CO., LTD.

MANCHESTER: Blackfriars Bridge. And at GLASGOW and PARIS.

springs at Thirlmere as at Longdendale. They will never be missed. The moment the water comes down it rushes along the hard, impervious rock straight into the reservoir. When the lake is full to the level to which it is being raised by an embankment now almost completed, we shall be able to rely upon Thirlmere for a supply of 50,000,000 gallons per day for 150 days, even in periods of the greatest drought. The great aqueduct by which this volume of water may be carried through hill and over dale for a distance of 95 miles is finished. It is the longest channel of the kind that the world has seen. The greatest of the Roman aqueducts, the Anio Novus, constructed in the time of Claudius, was only 62 miles long, but it held the "record" until Liverpool went to the Vyrnwy and brought water from Wales through tunnels, pipes and syphons over a distance of 75 miles. Manchester has now beaten both Rome and Liverpool.

Generations hence the Thirlmere aqueduct will perhaps have its full complement of five iron conduits, each capable of conveying 10,000,000 gallons per day, but at present only one of those pipes has been laid down, and the necessity of a second is not likely to be realised for twenty years. The aqueduct commences at the south-east corner of the lake, and at such a level that the surface of the water running into it at the entrance will be about 531 feet above Ordnance datum. The water will be delivered into the Prestwich service reservoir at a height of 353 feet, and will therefore have a fall in the length of 178 feet. In the first 22 miles of the aqueduct there are 17 tunnels, having an aggregate length of 14,000 yards, and 7 syphons, with an aggregate length of 9,000 yards, the remaining 15,700 yards consisting of "cut and cover." The greatest length of a single tunnel is 5,225 yards, and the greatest depth 660 feet. Progress at Thirlmere has been somewhat retarded owing to an engineering difficulty which arose some time ago in the construction of the embankment at the northern extremity of the lake. A fault in the rock necessitated the excavation of 11,000 cubic yards of stone out of a narrow gorge, which had afterwards to be filled in with an equal proportion of concrete, in order that the engineer might go 50 feet lower than was originally intended for a secure foundation. Should the winter continue favourable we may expect to see the work so far completed as to put us in possession of a daily supply of 10,000,000 gallons in the course of the next few months. The scheme will then be about fifteen years old, for, although the works were not commenced till 1885 the Act of Parliament was passed as long ago as 1879, and it will then, as we have

indicated, have cost about 2,500,000/. Each additional 10,000,000 gallons per day will entail a further expenditure of 500,000/., so that the cost of the scheme when it is actually finished at some far distant date will have reached a total of about 4,500,000/. This is a big amount, but it falls considerably short of a certain estimate referred to by Sir John Harwood in his "History and Description of the Thirlmere Water Scheme." Sir John tells us that on one occasion when the committee were visiting the works they were privileged to overhear a conversation between a countryman and a stone-breaker. The stone-breaker said to his companion, "Thoo sees that man theear wid' white heid?" (pointing to the late Mr. Alderman Grave). "Yis," replied the other. "Well," continued the stone-breaker, "he's gitten 't intul his heid to tak' watter oot o' t' lake fra here ta Manchester;" upon which the man laughed and said, "What! Theear's nut munny aneuf in aw t' world as wad deuh 't."

The hydraulic power sub-committee do not intend to wait for the new water supply, but promise to place their installation at the service of warehouse tenants on the 1st of next month. The engine-station is nearly completed, and most of the piping has been laid down in the area of supply, which includes Portland Street, Deansgate, Quay Street and Corporation Street. About 1,000 lbs. pressure to the square inch will be obtained at the central station, and this force will be tripled by intensifiers placed in the premises of customers. The committee are in possession of land sufficient to enable them when necessary to build two more stations, and they have already decided to extend the original scheme, under which about ten miles of piping have already been laid down. The water supplied under hydraulic pressure will be taken from the city mains, and therefore will be exceptionally pure, which will clearly be to the benefit of the consumer's machinery. Pressure of 1,000 lbs. to the square inch is 33 per cent. above usual practice, while it is fourteen to twenty times greater than the pressure in the ordinary mains, which in many cases is found efficient. One thousand gallons of hydraulic water will thus be worth fourteen to twenty times the value of the ordinary water supply for such purposes. Another novelty in municipal enterprise—novel only, however, in relation to Manchester—is the electric-light installation, which has done so much to brighten the shop windows in the murky streets of the city within the last two months. The system was fully described in these columns at a recent date, and it is only necessary now to add that the number of applications for a supply

WINTER, WARMTH & COMFORT.

GRUNDY'S SPECIALTY. PURE WARM AIR.
UPWARDS OF ONE THOUSAND TESTIMONIALS RECEIVED.

PURE WARM AIR, as Supplied to

Truro Cathedral; Londonderry Cathedral; Sherborne Abbey; Kilmore Cathedral; Stanley Cathedral, Falkland Islands; Cardiff Catholic Cathedral; the Queen's School Chapel, Eton; Cork Asylum; Leicester Asylum; and to upwards of three thousand Places of Worship; and a great number of Mansions, Houses, Hotels, Hospitals, Schools, Warehouses, Factories, Workhouses, &c.

84 Brook Street, Grosvenor Square, W.: December 8, 1893.
Sir WILLIAM BROADBENT encloses cheque for the "GRUNDY" HEATING APPARATUS supplied to his house, and is glad to say that it has proved very satisfactory for warming and ventilating as required. The principle of the apparatus is most excellent.—To Mr. Grundy.

PROFESSOR TYNDALL writes:—

October 24, 1893: Hind Head House, Haslemere.
Dear Sir,—My house being so well provided with grates and flues for the generation and distribution of pure warm air, I have been thus enabled to spend my winters in England instead of on a foreign shore.—Yours very truly,
JOHN TYNDALL.

Dr. GRIEVES says:—
I have insisted upon my architect adopting the "GRUNDY" system of pure warm air for Heating and Ventilating Buckhurst Manor. I should not like my house warmed with any other method, for I like plenty of ventilation and do not approve of stagnant air.

Book of Testimonials gladly forwarded gratis on application to

JOHN GRUNDY,
30 DUNCAN TERRACE, CITY ROAD, LONDON;
And TYLDESLEY, NEAR MANCHESTER.
Telegrams:—"JOHN GRUNDY, LONDON."

of the light has been so enormous that the committee will probably have to extend their plant in the course of the winter. The original capital of 100,000*l.* which was devoted to the scheme has been drawn upon to the extent of 70,000*l.*, but it is the intention of the Corporation to set aside an additional sum to be applied to the further development of so successful an enterprise. The installation has been in full use since last September. In July a temporary two-wire arrangement was brought into operation from the station in Dickinson Street, and had continued for about three months when, by a remarkable feat in electrical engineering, it was replaced within the space of a few hours by the five-wire system, which will now continue in permanent use. The outer boundaries of the square within which mains have been laid comprise Deansgate, Peter Street, a portion of Oxford Street, Portland Street, Piccadilly and Market Street. Eventually, if one may judge by the map on which the prospective lines of the electrical current are traced, this square may be expected to extend its four sides so as to enclose all the most important business thoroughfares in Manchester.

Electricity, however, is not going quite to kill gas as a means of illumination in the city. At present our gas supply cannot be said to give universal satisfaction. The Corporation obtained power during last year to borrow 500,000*l.* for gasworks purposes, and the money is being spent. At Bradford Road, we are informed, the manufacturing and purifying plant has been practically doubled during the last eighteen months. The storage capacity is equal to 6,000,000 cubic feet of gas at present, but a new holder is in course of erection which will store 7,000,000 cubic feet. Stoking machinery on the West pneumatic principle has also been introduced, and is working most satisfactorily. At Rochdale Road the efficiency of production has been improved by the reconstruction of the retorts in one house, and at Gaythorn a new gasholder to contain about 1,500,000 cubic feet of gas would have been quite complete by this time had it not been for a slight leakage of water which has had to be remedied. A holder to contain 525,000 cubic feet has been erected at Droylsden, where new retorts on the sloping principle are now in satisfactory operation. Altogether the capacity of storage will be increased during this year from its present limit of 18,000,000 cubic feet to 25,000,000 cubic feet. Including the works mentioned, it is proposed during the next eight or ten years to expend on Bradford Road works 135,000*l.*; on Gaythorn, 35,000*l.*; on Rochdale Road, 50,000*l.*;

on Droylsden, 17,000*l.*; on street mains, 200,000*l.*, at the rate of 20,000*l.* a year for ten years; on meters and stoves, 50,000*l.*; and on miscellaneous work, 15,000*l.*, bringing the total up to 502,000*l.* These are figures suggestive of enterprise, if not of severe economy, and they represent an extraordinary growth in the manufacture and distribution of gas in the city. From the very inception of the process, however, Manchester has taken a prominent part in its development. Salford, significantly enough (as Mr. Southern might say), was first in the field. It was in 1805 that the first building in the borough was lighted with gas, but only two years later the Police Commissioners of Manchester boldly affixed a public lamp opposite their premises in Police Street. In 1824 Manchester found itself in the position of being the first municipal authority to obtain powers for the manufacture and supply of gas—an enterprise which now yields a yearly revenue to the Corporation of more than half a million. Any review, however hurried, of public improvements in Manchester in 1893-94 would be incomplete without a reference to the great scheme of main drainage which has converted Manchester into what sanitary engineers call a "water-carriage" city. The aim of Mr. Allison, the city surveyor, was to obviate in any part of his design the necessity of pumping. In this he has been successful. The whole drainage of the extended city will eventually be directed by gravitation to the outfall works at Davyhulme. Originally the cost of this laborious undertaking was estimated at 500,000*l.*, but the addition of several townships to the city has extended the field of operation and increased the cost by about 100,000*l.*

Before the new year has run its course the map of Manchester will call for considerable modification. Broader lines will have to be cut through some of the square masses which indicate the denser centres of business population. Between the Ship Canal Docks at Pomona and the principal highways leading north, south and east, wider channels are about to be opened for the volume of traffic which is expected to follow the event of to-day. Whitworth Street, which will provide a broad thoroughfare between Oxford Street, London Road and the Openshaw district, will be completed early in the year; and the Corporation has obtained Parliamentary powers to continue the artery in the opposite direction by widening Gloucester Street, South Junction Street and Gaythorn Street as far as Chester Road. Chester Road, being of sufficient width as it stands, forms a link between Gaythorn Street and Hulme Hall Road, where the work of extension will be taken up and continued to the canal. Cornbrook Road is also to be widened,

and these alterations will necessitate the reconstruction of a viaduct over the Bridgewater Canal. Railway extension in the neighbourhood of Victoria Station is leading to further street improvements, which will greatly relieve the congested thoroughfare of Rochdale Road. Shudehill from Hanover Street to Miller Street will be widened to an average of 20 yards, while Miller Street will attain an average width of 16 yards between Charter Street and Beswick Street. In the course of the year the Corporation will apply for Parliamentary powers to carry out the important scheme which has been formulated for adding to the public highways a portion of the enclosed ground surrounding the Manchester Cathedral. From the ornamental point of view this promises to be the greatest improvement of all. The cathedral, although hemmed in rather narrowly by a new and, it is to be hoped, a better-looking boundary wall, will impend with greater prominence upon a spacious thoroughfare, with the result, if anticipation is realised, that both street and building will gain in dignity. New edifices are rising in every district of Manchester to testify to the vitality of the community. One of the most interesting is the strong-walled structure of ecclesiastical aspect which is slowly rearing its deeply-recessed arches on one of the most prosaic sites in Deansgate. A kind of mystery which attaches to the building is deepened by the circumstance that most of the splendid masonry is darkened on either side by the opposing walls of two of the most insignificant lanes in the city. The building is, however, to be dedicated to a noble use. It is destined to be the home of the Althorp Library, which Mrs. John Rylands is bringing to Manchester as a monument to her late husband. Progress will no doubt be made during the year with the new technical school building which is about to be erected in Sackville Street at an estimated cost of 85,000*l.*, and we may almost take it for granted that before the year closes Manchester will be possessed of one of the finest medical schools in the country, in the new buildings which the Council of Owens College are erecting at Lloyd Street.

BUILDING IN GLASGOW.

ACCORDING to the *Glasgow Herald* the building activity of 1892 was fully maintained during 1893. The low rate of interest prevailing for money and the lack of safe investments has favoured the property market. The long spell of inaction that followed the speculative mania of 1872-76 caused the natural growth of the population to overtake the house

accommodation. The speculative builder is therefore once more in the field, and covering it—north, south, east and west—with a rapidity that is truly astonishing. The total number of new linings that have passed through the Dean of Guild Court during the past year numbers 542, and the valuation of these amounts to no less than 1,284,670*l.* It may be interesting to note that the greatest number of houses passed were those of two apartments, the number being 1,462, against 441 houses of one apartment. It is also satisfactory to know that houses of three apartments are in demand and that there have been passed 774 of these; while four, five and six apartment houses have only been increased during the year by 154, 54 and 77 respectively. We have added nine new public buildings valued at 58,000*l.* Churches, schools and halls amount to the respectable total of 101,900*l.* The most important structures of all, and those which to a large extent make the demand for the others, are the large additions which have been made during the year to our warehouses, stores and workshops. One hundred and five of these have been granted, the cost of which is estimated at 471,690*l.* The old saying still holds good that "One man builds up and another pulls down." Alterations and additions figure in the records of the court to the tune of 80,900*l.* In addition to this, public works such as the Central Railway with its connecting lines, the subway, the sewage works, the new docks at Cessnock, all tend to make labourers scarce, masons and bricklayers especially. Their wages have never been as high in this part of the country as now. Joiners have been more easily obtained, the unfortunate strike on the Clyde and the general depression in shipbuilding throwing a large number of them into the building trade. Plumbers still continue brisk—thanks to the Health Committee, who are still pursuing their water-closet reform with vigour. The other departments of the trade share the general prosperity and the outlook for the coming year is certainly good.

THE MASTER WRIGHT AND THE ARCHITECT.

AN address was delivered by Mr. William Forrest Salmon, president of the Glasgow Institute of Architects, at the quarterly meeting of the Glasgow Master Wrights' Association. He said: Since agreeing to take the opportunity which you so kindly afforded me of addressing you, a few thoughts have occurred to me in regard to the relationship of the master wright to the architect, and these I will try to put before you as clearly as possible. I will speak, first, "Of the affinity of the master

wright with the architect"; second, "Of man's earliest efforts at building"; third, "Of the evolution of architecture"; and fourth, "Of the aims of the architect and the builders."

It will be readily acknowledged by you that a close affinity exists between the architect and the master wright. An architect here and there may be possessed of so much practical knowledge that without the aid of a master craftsman he can select material and direct workmen; but, as a general rule, an architect has not so much knowledge, and even if he had, experience has proved that it is not the best way for him to use his talents. It is the universal practice now for architects to employ their gifts in designing, preparing working drawings, choosing materials and supervising their works. The architect's duties are thus confined within certain clearly-defined boundaries. Outside of these boundaries lie vast fields of work in which other men must labour before any building can be erected. There may be as many as fifteen or twenty different crafts engaged in one building alone, and over each of these there must be a wise, experienced and responsible head. One of these (and in many buildings the chief one) is the master wright, and it is about him that we are concerned to-night. If a building is to be successfully carried out the master wright must bear a very important share in the responsibility. A building may be very carefully designed and most carelessly put together. The knowledge, the experience and the judgment of the master wright must be exercised. We architects know this, and we take care to select master wrights in whom we can place reliance.

I am quite sure that you could tell me far more than I can tell you of the knowledge required, and the time taken up, and the labour entailed in the acquisition and selection of suitable timber for the several sections of the work, in the cutting of it so as to turn it to profitable account, in the choice of men for the different parts of the work, and in the setting out of work for the different men. In these, and in many other ways, your work and the architect's work lie side by side. A mutual helpfulness is demanded in order to secure a satisfactory result. Your interests and the architect's are common. To thwart the architect would be derogatory to your own interests, for you take much trouble with the buildings on which you are employed, and devote the best energies of your short life to this work. You naturally take a pride in your own productions, and we architects ought to make you recognise that the work you do is the result of your own skill and devotion. It may gratify you to know what is a fact, that

when an architect visits a fellow-architect's building, an almost invariable question is, Who was the mason and who was the joiner? More particularly is this question put when the work is good, and the architects praise the good tradesmen without stint. I have thus shown very clearly that the master wright is in close affinity with the architect, and it is in the interests of good architecture to make not only the master wright but the master in each trade conscious that he has a large share of the work and the responsibility, and that each piece of work he does will be to his credit or to his discredit. We are all fellow-workers, and architecture is the result of our joint labours.

I have spoken of the present close affinity that exists between master wrights and architects, and I should like now to refer to their historical affinity. Man in his earliest efforts at building took the material which was most easily procured, viz. the timber of the mighty and dense forests which lay around him. No doubt primæval man took shelter in caves and even formed caves in the earth and built mud huts, but the earliest efforts at serious and skilful construction were with timber, where such could be procured. The door-posts and lintels, the roof carried on the upright walls, the framing of several timbers together so as to support one another, demanded careful consideration and invention. Man was compelled thus to design, and the first start was made in architecture. I am not sure that Mr. Ruskin would quite agree with me in this statement. In his "Seven Lamps of Architecture," he says:—"Architecture is the art which so disposes and adorns the edifices raised by man for whatsoever uses, that the sight of them may contribute to his mental health, power and pleasure." This general statement of Mr. Ruskin's is very good, but he goes on to enlarge upon it as follows:—"It is very necessary in the outset of all inquiry to distinguish carefully between architecture and building. To build—literally to confirm—is by common understanding to put together and adjust the several pieces of any edifice or receptacle of a considerable size. Thus we have church-building, house-building, ship-building and coach-building. That one edifice stands, another floats and another is suspended on iron springs, makes no difference in the nature of the art, if so it may be called, of building or edification. The persons who profess that art are severally builders, ecclesiastical, naval, or whatever other name their work may justify; but building does not become architecture merely by the stability of what it erects; and it is no more architecture which raises a church or which

fits it to receive and contain with comfort a required number of persons occupied in certain religious offices than it is architecture which makes a carriage commodious or a ship swift. I do not, of course, mean that the word is not often or even may not be legitimately applied in a sense, as we speak of 'naval architecture'; but in that sense architecture ceases to be one of the fine arts, and it is therefore better not to run the risk by loose nomenclature of the confusion which would arise, and has often arisen, from extending principles which belong altogether to building into the sphere of architecture proper." Mr. Ruskin is endeavouring to guard the sacred term architecture from abuse, and I have no desire to nor would I contradict him. I would not have you imagine that every building is an architectural production. What I wish to show you is, that the early attempts at building were the first stages of architecture, not man's first attempts at architecture as that is understood now. My position is, that man's earliest efforts at building were the first steps which led him to discover the art of architecture which was as yet unrevealed.

Well, then, who made these first efforts? Who cut and shaped the timber and framed it together? Were they not your progenitors? Shall we call these designing men the master wrights of those days? During the early centuries of the Christian era, before the light of the Gospel was brought to the shores of Britain, many of the wild residents of this island built their dwellings in the lakes to protect themselves against sudden attack. These lake dwellings, or crannogs, were constructed of timber. There was one unearthed about twelve years ago at Mid-Buiston Farm, near Kilmaurs, in Ayrshire. I remember visiting it. The lake has disappeared, but the contour of the country shows where the lake was. A large part of a wooden platform, nearly circular, about sixty feet diameter, still exists, fixed partly to stakes driven into the mud and partly on a foundation of tree trunks laid together horizontally in courses, with brushwood between. Upon this platform the former dwelling or dwellings had been built. A number of flint implements, arrow and spear heads of metal, combs and other objects of bone, rings of gold, bronze objects and pottery were found. I am not sure where these are preserved, but if you take the trouble when next in Edinburgh to visit the Antiquarian Museum, you will see many such objects found at similar lake dwellings in Scotland.

The point I wish to enforce to-night is, that these structures were designed by master wrights, and that skill and designing power had to be exercised before they were erected. But not

only in this country were the busy and fruitful-brained master wrights at work, for in all countries the same thing was going on. Even to this day in barbarous and semi-barbarous countries, and in countries which new settlers are now possessing, the same process is going on. The master wright is the pioneer of the architect, and by-and-by he develops into the architect. The opinion might quite reasonably be held that the first men who thought of other materials, such as brick, stone, marble, &c., were the master wrights, and that from their ranks the earliest architects came. It is interesting to notice that in those early times, although there was no timidity shown in the employment of timber, brick and stone were used with great caution; the walls and pillars were made exceedingly massive, as if fear was entertained that wind or floods would carry them away unless they were enormously strong.

Perfect freedom and abandonment in stone construction was not indulged in until about the twelfth and thirteenth centuries of the Christian era—thousands of years after stone construction was first attempted. At that time those lovely cathedrals in France were erected, where grace and refinement were carried so far that there is no beyond to struggle for. Had mason-work developed first, man might have reached that refinement in stone building at an earlier date, but timber construction developed first, and the architects were for a very long time exceedingly timid in their use of the new and untried material. When certain building laws are agreed upon, or when a certain style of building is adopted, centuries pass before great changes are ventured upon, and no doubt we are greatly indebted for the changes and developments of the styles to the gradual discoveries which were made of the possibilities of the various materials which came to be used for building purposes.

I think I have succeeded in showing that the master wrights have had their share in the development of architecture, which in many ways is the greatest and most wonderful of all the arts. If you acknowledge and allow this, then I wish you to place yourselves in a position of responsibility. Your predecessors, if my historical ideas are correct, were the founders of architecture. Their early efforts marked the beginning of the art of building, and those with the sense of beauty more strongly developed marking how the sunlight scintillated on the projections and cast shadows under the eaves, and how the groups of buildings added a new beauty to the surroundings, strove to enhance the loveliness with added grace. Thus the art grew, and now it is so

great, and the labourers in it are so numerous and so various, and their interests are so isolated, that grave dangers assail its fair fame. In the great struggle to keep architecture pure and free from blemishes you master wrights must bear a part. The architects have to prepare the designs and supply the drawings, but the masters in the different trades have to buy the materials, see that these are in proper condition, shape out the work and direct the workmen. Your work, then, is of high importance. You cannot too highly regard it, and it is the architect's duty to inspire every one engaged with him in the production of a building with the feeling that he is doing an important part of the work, and that to him will a share of the credit be due. To quote Ruskin again:—"There is no action so slight nor so mean but it may be done to a great purpose and ennobled, therefore, nor is any purpose so great but that slight action may help it." So, then, you master wrights and we architects are fellow-workers, and in our respective callings we ought "to provoke one another to love and to good works"—to love our art, and to efforts to produce good art. There always have been architects who have striven to do so, but there have been a great many who have failed completely, sometimes for lack of effort and sometimes for lack of ability.

At the present moment there exists a strong tendency to advance in architectural development. A spirit of dissatisfaction with the later productions is everywhere manifesting itself and a true appreciation of what architecture is appears to be taking possession of a thoughtful section of the public. Those practising architecture have become aware that it will not suffice to plan a building, and then clothe its nakedness in the architectural details of a Greek temple or a Gothic cathedral, but that each building must be a living expression of its own uses. If it is to exist as an abiding work of art it must tell its story not only to its own generation, but to the generations following. To be an architect in these circumstances is a difficult and hard thing, and if an architect's endeavours are in such directions he ought to be surrounded by master masons, master wrights and masters in all the various trades that will help him and not hinder him. That such masters are to be found we are well aware, but they are not so common as they should be, and since you have asked me to address you to-night from the architect's standpoint, I would have you take seriously into your consideration the situation as I have presented it to you. There are earnest, good architects, and there are earnest, good craftsmen. The good architects will, as a rule, get the good

work to do, and they will seek for the good craftsmen to carry it out. The architect and the craftsman have the same choice put before them. If they would be entrusted with good work they must show themselves worthy and fit for it. The aims of a good architect are to design his buildings appropriately and artistically, and to get them carried out by honest and skilful hands. The aims of a good craftsman are to carry out the work he undertakes with the best material and in the best manner. The work thus cut out for the architect is an arduous one that will tax his energies to the utmost, and the work for the craftsman is not less arduous. His knowledge of material must be thorough. He must devote careful attention to its selection. He must employ the best workmen. He must be so educated in architectural details as to be able to interpret and give expression to the architect's drawings. In this way the craftsman takes a high rank.

We architects begin to feel more and more that in order to produce architecture worthy of the name, we must not only have honest craftsmen, but art craftsmen. It is desirable for you master wrights and for your workmen to have art instincts and art knowledge. A man with an instinctive love of art will impart an added grace to the piece of work he produces, and this quality of beauty in it will appeal to the artistic and cultured mind. It is not only the great masses of a grand old building which command attention; the very chisel-marks often exhibit the workings of the devoted heart, the earnest soul, and call forth admiration. Let me counsel you, therefore, to seize every opportunity you have to enlarge your knowledge of art generally and of architecture particularly, and to encourage your workmen to do the same. It appears to me that the time when you might influence your workmen most successfully in this way is during their apprenticeship. I rather fear that during the five long years apprentices are kept pretty closely at their ordinary work from early morning till dewy eve, and that if any of them attend classes it is after their hard day's work is over, and independently of their masters. Would it not be well for you masters to consider in what way you could inspire higher thoughts in your workmen at this initial stage? They are then easily influenced by you, and if you drew up a curriculum they would no doubt be anxious to pass through it and learn as much as possible. At all events, the members of this association might take this suggestion into their serious consideration. We have an excellent art school in Glasgow which ought to be taken advantage of. The Institute of Architects is taking a deep interest in this school

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PAYTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES

completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE

is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

ARCHITECTS' Plans and Designs exactly and faithfully worked to.

Tenders Free for ELECTRIC LIGHTING.

SANITARY Work, STRUCTURAL Alterations, and every kind of Interior & Exterior DECORATIONS.

N.B.—House and Estate Agency Offices (213 Tottenham Court Road),

440—English Carved Oak Writing Table, Leather Top, on Casters. £15 10s.

Without Drawer and Pigeon-holes on Top, £10 10s.

and there are architects on the governing body whose influence is considerable in directing its affairs. We should like to see its classes filled to overflowing. We think the masters of all the building trades should encourage their apprentices and their workmen to attend the classes.

I feel sure that the master wright's success in the future, as well as an architect's, will turn largely on this very question of art. The craftsman who understands and appreciates art will come to the front, and the buildings which are artistic will live and be carefully preserved and handed down as treasures to the future generations. We will die and be forgotten, but our work, if it is worthy, will live. The care and thought of the architect will be ever manifest, and the labour and devotion of the craftsman will continue to tell its story. In one of Ruskin's eloquent passages, where he is defending richly ornamented buildings, he says:—"It is not less the boast of some styles that they can bear ornament than of others that they can do without it; but we do not often reflect that those very styles of so haughty simplicity owe part of their pleasurable contrast, and would be wearisome if universal. They are but the rests and monotonies of the art; it is to its far happier, far higher exultation that we owe those fair fronts of variegated mosaic, charged with wild fancies and dark hosts of imagery, thicker and quainter than ever filled the depth of midsummer dream; those vaulted gates trellised with close leaves; those window labyrinths of twisted tracery and starry light; those misty masses of multitudinous pinnacles and diadem tower, the only witnesses, perhaps, that remain to us of the faith and fear of nations. All else for which the builders sacrificed has passed away—all their living interests and aim and achievements. We know not for what they laboured, and we see no evidence of their reward. Victory, wealth, authority, happiness—all have departed, though bought by many a bitter sacrifice. But of them and their life and their toil upon the earth one reward, one evidence is left to us in those grey heaps of deep-wrought stone. They have taken with them to the grave their powers, their honours and their errors. But they have left us their adoration." But we must not be carried away altogether by the soul-stirring and loving language of this great writer, nor imagine that it is only in enduring works of architecture that man's labours are well spent, for every life that has been faithfully lived, every act of whatever sort that has been done in a true spirit, and every word that has been fitly spoken, has shed its light and stamped its truth upon our human race. There have not only been earnest and true labourers in the sphere of

architecture, but in every sphere which man has yet discovered. We rejoice, however, that there have been high-souled men in the ranks of architects and builders in the past, and it is for us so to act that we shall help forward the noble cause of truth and virtue. It matters not whether we be architects, master wrights, or workmen—

All service ranks the same with God,
With God whose puppets best and worst
Are we: there is no last nor first.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

recreation-grounds. The necessary work in the making and erecting of the same has been carried out by Messrs. Wm. Potts & Sons, of Leeds, and the builders' work by Messrs. Charnock & Sons and Edward Foster & Sons, of Halifax.

THE Workhouse, Grimsby, is being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE minutes of the Waterworks Committee, submitted at the meeting of the Bradford County Council, included a recommendation to accept the tender of Messrs. Morrison & Mason, Limited, of Glasgow, for the construction of a main aqueduct from the river Nidd to Chellon Heights, a distance of $3\frac{1}{2}$ miles, together with branch aqueducts and other work in connection, for 286,259*l.* 7*s.* 10*d.* Mr. Holdsworth, chairman, said the tenders were close on the estimate of the engineer.

THE Runcorn Rural Sanitary Authority have decided to accept the tender of Messrs. E. Timmins & Sons, Limited, Runcorn, amounting to 3,100*l.*, for the construction of waterworks for Frodsham.

THE new fire engine purchased by the Southport Corporation from Messrs. Merryweather has just been submitted to its first public trial in front of the Cambridge Hall. The mayor, Dr. Wood, performed the initial ceremony of lighting the furnace, and in 8 minutes 20 seconds a steam pressure of 100 lbs. was registered. With a single jet, measuring $1\frac{1}{2}$ of an inch in diameter, a fine volume of water taken from the public fountain by means of suction pipes was sent over the Cambridge Hall, and other successful experiments were made with $1\frac{1}{2}$ inch, $2\frac{3}{8}$ of an inch jet; also three jets playing simultaneously.

THE Leamington Town Council have accepted for the construction of a new reservoir for the Lillington water supply works the tender of Mr. Bowen for 1,492*l.*

THE Harrogate Town Council have accepted tenders amounting in the aggregate to 64,701*l.* for the erection of the new Montpelier Baths.

MESSRS. COMYN CHING & CO., of London, the patentees and proprietors of the original Thomas Boyle's patent "Mica" flap ventilator, have added a very important patented improvement, doing away with any fault that could be found with the original. By the introduction of a shield plate at back with intermediate baffle plates, arranged in accordance with

scientific principles, it will be found that whilst a free flow of air passes through the ventilator, the direct pressure is taken off the flaps, and they are now entirely protected from the smoke in the chimney, and the reverse action has been entirely overcome. The improved ventilator can, it is claimed, be confidently fixed in any air-shaft or smoke-flue; its action is steady and continuous, requires no attention when once fixed according to directions, is a sure preventative of back-draught, and is smoke-proof and absolutely noiseless in action. The smoke or dust cannot reach the valves, so that no corrosion of the hinges takes place from this cause, and the material is all incombustible; hence these ventilators are practically everlasting.

AT Dudley an inquiry has just been held respecting the application of the Town Council for sanction to borrow 8,653*l.* for public improvements of Netherton and Woodside, and 1,600*l.* for the completion of the new road from Dudley to Netherton. The estimated cost of the Netherton public hall is 2,797*l.*, the Netherton and Woodside public buildings 1,166*l.* and 1,000*l.* respectively, and the two free libraries 3,500*l.*

FOR a long time the Southend Town Council have been considering the drainage of the borough, and they have adopted a scheme prepared by Mr. Mansergh, C.E., for the perfecting and completing of the system.

THE Wolverhampton Town Council have accepted the tender of Mr. Herbert Holloway, of Bilston Road, amounting to 4,349*l.*, for the execution of work in connection with the main drainage of the western portion of the borough in the Newbridge district.

WE have received a letter from Mr. Charles H. Rosher in regard of a notice that appeared in our issue of the 22nd ult., entitled "Steam Jet Pumps." Mr. Rosher says:—"The 'Rain-bow' water raiser was the first to make a market, and among numerous rivals which have sprung up in imitation of it, still holds its own. I have used it and similar appliances for the last ten years for the purpose of heating and circulating water for baths, laundries, &c., and for warming air of buildings by hot-water circulation, and know others who have done likewise, and for this reason am surprised to read of the coming revolution." As the introducer of the "Rosher system" of heating and circulating large bodies of water in swimming baths, &c. (a system which was used at "Venice in London" and is now in use at "Constantinople at Olympia" on a very large scale), he protests against the pretensions of the notice in question claiming to describe a novelty.

"SPHINX" PORTLAND CEMENT

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch seven days. Fineness, 250 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving. "ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 8 parts. Standard Testing Sand, 380 lbs. per square inch: 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

JOHN BOARD & CO., Dunball, Bridgwater. ESTABLISHED 1844. NATURAL PORTLAND AND ROMAN CEMENTS, HYDRAULIC BLUE LIAS LIME, Plaster of Paris, Keene's and Parian Cements, Bricks, Roofing Tiles, Drain Pipes, Paving Tiles, Bath Bricks, &c. Railway and water communication.

OUR SYSTEM OF

BUILDING AND BUILDERS.

THE *Glasgow Herald* says:—Mr. Quarrier, of the Orphan Homes of Scotland, announces another gift of 1,000*l.* from a friend in Glasgow. The gift is the second one of 1,000*l.* from Glasgow, besides several smaller sums, and also 1,000*l.* from Liverpool, as well as 3,000*l.* from the East of Scotland, to build one of the homes.

At the meeting of the Metropolitan Asylums Board, a recommendation of the General Purposes Committee to erect a hospital at Shooter's Hill, to accommodate 500 patients, at an estimated cost of 220,000*l.*, with 300 nurses attached to it, was referred back for further consideration.

THE Tipton School Board have decided to purchase a plot of land situated on the Toll End Road, consisting of 4,500 square yards, at 3*s.* per yard, for the proposed new school for Ocker Hill.

THE *Leeds Mercury* says:—One of the oldest inhabitants of Hartlepool, Mr. J. Bridges, the sanitary inspector of the borough, has passed away, after a lengthy illness, at the age of seventy-two. After being apprenticed to Mr. Grainger, of Newcastle as a builder and joiner, Mr. Bridges came to Hartlepool as foreman joiner to the late Alderman Todd. Subsequently he went into business for himself, and in 1864 was joint-contractor for the erection of the Town Hall and Court House, and at a later period was in partnership with Mr. John E. Robson, as a saw-mill proprietor.

AN isolation or fever hospital is to be erected at Towyn, near Rhyl, from the designs of Mr. James Hughes, of Denbigh.

THE Albert Palace, Battersea, appears to be doomed to demolition, for notices have been set up announcing that the ground is to be sold for building purposes.

VARIETIES.

THE *British Medical Journal* says:—"The practice of keeping carbolic acid in bottles without labels or other distinguishing mark has been the cause of two more cases of accidental poisoning, one of them ending fatally. At a Christmas Eve party in Hull the acid was poured out in mistake for rum, and in one instance swallowed at a draught. We take this opportunity of expressing the hope that this

matter will receive speedy attention from the authorities, whose approval of the recommendation to place carbolic acid in the 'poison' schedule is requisite for making precautionary measures compulsory." We might add that the above paragraph merits attention, as the primary object of sanitary preparations is to aid the chances of life by removing unhealthy conditions that are prone to engender illness or endanger life. The only thing to be said is that those who have fallen victims of carbolic acid, wrongly used, had no lingering illness to endure before death.

THE Melton Mowbray Local Board have decided to adopt the International system for the purification of their sewage, and have instructed Mr. Edmund Jeeves, C.E., architect and surveyor, of Melton Mowbray, to prepare plans for the works.

At the meeting of the Filey Local Board it was resolved to apply for powers to borrow 5,600*l.*, in addition to the 12,000*l.* already borrowed. Of this 3,000*l.* are required to complete the sea-wall, 1,600*l.* for drainage works, and 1,000*l.* for the land and buildings for the Local Board Offices.

A PROPOSAL has been suggested in the Municipal Council of St. Petersburg for an international exhibition to be held in that city in 1903, on the occasion of the 200th anniversary of the foundation of the capital by Peter the Great.

THE Liverpool Architectural Society will hold its fourth ordinary meeting on Monday, the 15th inst., when Mr. W. H. Bidlake, M.A., will read a paper entitled "Imagination in Planning."

MR. JOHN CHESSELL BUCKLER, of Melbury, Cowley, St. John's, Oxford, who completed his 100th year on December 8 last, has just died. He was the eldest son of Mr. John Buckler, F.S.A. Inheriting his father's taste for the study of architecture, he practised as an architect till the ninetieth year of his age. He published a volume of "Etchings of the Cathedrals of England and Wales" in 1822, "An Account of Eltham Palace," "Remarks upon Wayside Chapels" and a "History of the Architecture of St. Albans Abbey Church."

THE Fulwood Local Board in a Parliamentary bill ask for further powers for the improvement of their existing water supply. They propose to construct a reservoir at Goosnargh-with-Newsham, with a conduit or line of pipes connecting it with the existing reservoir, and to take water from the streams flowing into the Wyre. The Board propose to raise 30,000*l.* for the repayment of loans authorised by previous Acts,

Importers of Sicilian and Statuary Blocks, Slabs, Curbs, and Coloured Marbles, Scotch, Norwegian, Swedish and Saxony Granites.

Price, £1 10*s.* and upwards.

Portable Filters on this System, £1 5*s.* to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Baginbun Park, by H.R.H. the Duke of Cambridge, the *élite* of the Medical Profession and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4*s.* 6*d.* and 3*s.* each. Household and Fancy Filters, from 10*s.* Water-testing Apparatus for detecting Impurities in Water, 10*s.* 6*d.* and 12*s.* each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

10,000*l.* for waterworks purposes and 5,000*l.* for sewerage purposes.

At a meeting of the Wakefield Chamber of Commerce, Mr. Charles Clay, J.P., of Walton Grange, who presided, brought before the chamber the question of a ship canal between Wakefield and Goole. The idea was favourably received.

At Stratford-on-Avon an inquiry has been held by the Local Government Board with reference to an application of the Town Council to borrow 8,500*l.* for the purchase of land, &c., in connection with the water-supply, 500*l.* for the provision of water-meters and 450*l.* for works of street improvement.

At the meeting of the Widnes Town Council attention was called to the dangers of the level crossings in the borough. It was also agreed that the arrangements both as regards train service—particularly through traffic—and station accommodation were totally inadequate to the requirements of the borough, and that in failing to comply with the reasonable requirements of the Corporation, the directors of the I. & N.W. Railway Company had treated the public wants with a lack of consideration, and that the Town Clerk be instructed to request the directors to give the matter their further attention.

The Bury Corporation have submitted a parliamentary Bill which proposes to authorise that body to construct new sewers and sewage works, the cost of which is estimated at 110,000*l.*, and to raise 50,000*l.* for gasworks purposes, 10,000*l.* for fire brigade purposes, and 3,000*l.* for additions and alterations to the refuse destructor. Among the provisions of the Bill is one which empowers the Corporation to compel the registration of gasfitters, and prohibits a gas consumer from employing any but an "authorised gasfitter" under penalty of a discontinuance of the supply, while other clauses authorise the Corporation to contribute to the maintenance of public bands of music and to provide seats for public use in the parks, gardens, &c.

At the meeting of the London City Commissioners of Sewers, it was stated that since the recent snowfall 2,000 of the unemployed had been engaged at a cost of 400*l.* to clear away the snow; 25 extra carts and horses had been hired in the work, which involved the cartage of 10,000 loads of snow.

MESSRS. EARLE'S SHIPBUILDING COMPANY of Hull have successfully launched a twin-screw steamer, which they have built for the Great Eastern Railway Company's continental service between Harwich and the Hook of Holland. This vessel, which was named the *Berlin*, is a steel twin-screw

steamer 302 feet in length by 36 feet beam, and has two separate sets of triple-compound engines, which are expected to give a speed of about 18 knots per hour. The cabin accommodation is similar to the *Chelmsford*, which was built by the same firm for the Hook of Holland route last summer, the *Berlin* being a sister-ship, with the exception that she has a little more length and beam. The Great Eastern Railway Company intend to have four boats of this type to perform the service.

MR. GEORGE ALMOND, of Burnham, Bucks, writes to us as follows:—Reading in *The Architect and Contract Reporter* for last week the account of "Early Pavement Tiles," I commenced making bricks here, and I am of opinion that there was a tile works here in ages past, as we met with floor tiles when ploughing up the land and making the clay. The tiles are 4 and 4½, and patterns and glaze are still perfect. We have discovered flint formations which may be remains of a kiln. We have met with a few Roman bricks, and I suppose they were about 9½ by 4½ by 1½. But I think it was more of a floor and tile works. Our church had some of these tiles previous to its restoration, and Hitcham Church close by contains some still; and a few years back a lot were dug up on the site of the old abbey here.

THE *Standard* says:—The series of accidents, many of them fatal, that have occurred during the last few days in connection with the bursting of kitchen boilers, demonstrates the existence of a danger as yet imperfectly apprehended, and perhaps still less understood. It is self-evident that if the supply of water is cut off from a boiler and steam continues to be generated without any outlet, an explosion must, sooner or later, ensue, the steam liberating itself by rending in pieces the vessel that contains it. A plug of ice in a communicating pipe will be quite sufficient to set up this perilous condition of things, providing there is no proper arrangement to meet such a contingency. In the case of the more serious class of explosions there is generally a species of high-pressure boiler in use, intended not only to serve the ordinary wants of the kitchen, but to supply hot water to the floors above. In all such cases there should be an exhaust pipe, to provide an outlet for superfluous steam. There are kitchen boilers, especially in the better class of houses, which are distinctly of the high-pressure type, and these demand a safety-valve of some kind.

THE *Leeds Mercury* says:—Mr. W. S. Braithwaite, architect, writes to us as follows:—Very few tenants living in houses

fitted and supplied with hot-water circulation have any idea how to manage the same. The maid or mistress under ordinary circumstances draws hot water from the tap, without the least knowledge as to how the hot water gets there. Special legislation is needed to enable the local authorities to compel builders to place the cisterns in rooms where they can be seen, and not in the false roofs, attic ceilings, and such places, where they are exposed, and where it is impossible for them to be examined. I would go further, and instruct children in the rudiments of hot-water circulation, that they may teach their parents. How many householders even know how to prevent their rooms being inundated with water when a thaw sets in, believing that the thaw causes the bursting of pipes, when the burst has, in fact, been caused by the expansion of ice in the pipes during the frost.

At the meeting of the Works Committee of Edinburgh and District Water Trust, a letter was submitted from Mr. Reid, of Messrs. J. & A. Leslie & Reid, engineers to the Trust, intimating that he had assumed Mr. Wilson, who is at present connected with the Greenock Corporation Waterworks, as a partner in his business, owing to the death of Mr. A. Leslie.

ELECTRICAL.

OWING to increase of business of the Electrical Installation Company, Limited, 64 Victoria Street, this company are extending their premises and announce that they are moving into additional offices at 66 Victoria Street, to which number their "general office" will be moved on Monday, the 8th inst. They have also started works in Pimlico, where they are manufacturing some of their specialties, *inter alia*, their new patent "Vauxhall" arc lamp, their patent "Britannia" automatic projector for marine and photographic purposes and apparatus for the application of their new system of electric heating.

THE Stirling Town Council, by the casting vote of the chairman, have resolved not to grant the application of the Caledonian Electric Supply Company for a provisional order to supply the burgh with the electric light. It is understood the company will nevertheless proceed with their application, which was supported by a petition signed by 171 shopkeepers and 217 residents, including nearly all those in the new part of the town.

At the meeting of the Gas Committee of the Aberdeen Town Council the rates to be charged for electric meters were settled. It was resolved that the charges should vary from 5s. to 30s. per quarter. It is expected that the meter that will be most commonly used will be the one on which the rate is 7s. 6d. per quarter.

At the meeting of the Liverpool Watch Committee a letter was read from the Gas Company stating that from the 1st inst. the charge for the supply of gas to the public lamps would be increased by 4d. per 1,000 cubic feet. The town clerk was instructed to write to the company expressing a hope that a reduction would be made in the price for the supply to the public lamps.

WORTHING is about to be the scene of experiments in the shape of sewage disinfection by means of electrolysed sea water. The Town Council have voted a considerable sum of money to enable M. Hermite, the French sanitary engineer, whose method of electrical sanitation has proved so successful at Havre, Lorient, &c., to get to work during the present month to demonstrate the efficiency of his system for the first time in an English town. If the system proves as successful as M. Hermite fully anticipates, it will be a very valuable solution of a problem which intimately concerns the welfare of every seaside community in the kingdom.

OPTIMUS 100-GUINEA PHOTOGRAPHIC COMPETITION, 1893.

WE have received from Messrs. Perken, Son & Rayment, a list of the awards in this competition:—

Class I.—Sub-class A, Transposed; sub-class B, J. H. Avery, W. Crofton Hammons. Class II.—Sub-class A, W. Galloway, J. C. Oliver, J. Wickens. Class III.—Geo. Reade, for a set of prints; Mrs. S. F. Clarke, for a set of prints. Class IV.—Transposed. Class V.—Sub-class A, Miss E. R. Marcus; sub-class B, transposed. Class VI.—A. F. Jarvis, for a set of prints; A. T. Bucknall, J. W. Morgan, T. G. Gamlin, R. Laverack, for a set of prints. Class VII.—J. H. Gear. Class VIII.—Transposed. Class IX.—E. Brightman.

In accordance with proviso on entry forms several prizes have been transposed to classes other than those originally named, the judges deciding such a course advisable.

PATENT LAWS.

THE Glasgow and Scottish section of the Society of Chemical Industry have held a meeting in Glasgow to discuss the Patent Laws of the country. Mr. Charles A. Fawsitt presided, and said there could be little doubt that an inventor had often very great difficulty in getting legitimate or fair protection. He no sooner patented something of value than there were many who tried to take the wind out of his sails, although not actually coming into collision with him. A system of research, if originated, might be of great practical use, and no doubt it would be very valuable if a body of men could be found to sift out those patents which had been anticipated, but there was always the suspicion that among these men there might be some who had an interest in a patent. There were very few who could judge clearly of the value of a patent, and although Chambers of Commerce had been suggested for such a purpose, he did not think that, as at present constituted, they were competent to judge upon such matters. Mr. J. S. Macarthur said he would rather have the British Patent Laws than those of Germany or America. He suggested a scheme whereby examiners should be appointed to look into the specifications of inventions, and report the result of their researches to the applicant for the patent. He thought it was absurd that the Government should place such high tax upon alcohol, as it allowed the inventors of other countries to get far ahead of this country in the matter of aniline (dyes and such things. Mr. G. T. Beilby thought there should be some method of restriction based upon proofs of practical success in attaining the objects aimed at, before an old patent should be allowed to stand in the way of a new application. Other speakers gave the meeting the benefit of their experience, and it was agreed to remit the information obtained to the committee of the society charged with the consideration of the subject.

THE ANTWERP EXHIBITION.

IN a letter Mr. De Courcy-Perry, the British Consul at Antwerp, says that few people in England realise the extent and importance of the approaching Antwerp exhibition. So far as regards the size of the grounds and the dimensions of the main buildings, it will be about one-third the size of the Columbian exhibition. Jackson Park has an area of nearly 600 acres, and the main buildings covered 80 acres. The park in which the Antwerp exhibition will be held is 200 acres, and the main buildings will enclose 25 acres.

The smaller buildings, which will be erected in the grounds, will be at least equal in beauty to those that adorned the American exhibition. As regards the importance of this exhibition, it is sufficient to say that France and Germany, Austria, Italy, the United States, Canada and other foreign countries will be largely represented, and that the industries of Belgium will be well displayed. There have been placed at the Consul's disposal, in the very best part of the building, for the use of British exhibitors, about 60,000 square feet (5,900 square metres), exclusive of the maritime display, which is under another organisation, so that there is ample room for British manufacturers to make a representative show. As no grant has been made to defray expenses, and as the exhibition authorities levy a tax on space, it is necessary to make a charge per square foot to exhibitors, this charge varying according to the importance of the location. This drawback is, however, compensated by the privilege accorded to exhibitors to sell for current delivery on payment of a small tax. The Foreign Office has authorised the Consul to accept the position of Commissioner-General, an appointment carrying with it full and complete control of the section, and not a little grave responsibility on account of the absence of a grant. The official headquarters of the British section are in Antwerp, and the Consul will have the advantage of the counsels of an advising committee, known as the Antwerp Committee, that meets in Antwerp or London, as may be most convenient. He has, further, the great advantage of the assistance of the London Chamber of Commerce, that has, under the chairmanship of Sir Albert Rollit, formed an executive committee, whose function is to interest manufacturers and induce them to come forward as exhibitors. All applications received by this committee, as well as those coming through the independent agencies, will be referred to the Consul for allotment, which will be made as quickly as possible.

informing British manufacturers on every point connected with the exhibition, the Consul hopes that the British section will hold its own against those of France and Germany.

IMPROVED FOLDING PARTITIONS FOR SCHOOLS, PUBLIC BUILDINGS, &c.

CONSIDERING what has been accomplished during the past few years in the way of improvements in machinery and patents of different kinds, one wonders what fresh fields there are for further developments, and the question arises, "Will they have to stop?" But when, day after day, we see and hear of this patent and that invention, we are forced to the conclusion that there are no bounds to the inventive ingenuity of the mind.

One of the ideas which often strikes one on seeing a new invention for the first time is, "How is it this has not been thought of before?" It appears so simple, and at the same time just what is required to supply a long-felt want."

Architects and others have been greatly puzzled in the past to find out the best and simplest method of dividing a large hall, public building or schoolroom by a temporary or movable partition easily moved, simple and reliable in construction. Many systems have been employed for this purpose, none of which have been altogether satisfactory. Among others may be mentioned the old-fashioned revolving shutters to coil up in a box in the ceiling, and movable slides which have to be taken down and refixed whenever the shutters are used. Other difficulties in connection with this arrangement are that an ordinary door and lock cannot be used, neither can glass be introduced for light and supervision; and further, the shutters are not rigid enough, nor are they sound-proof.

Panelled framing has been used in a variety of ways, too numerous to mention in detail. One plan adopted by some School Boards is to fix a piece of panelled framing one-third of the width of the school, and running two other sections behind it, the two loose sections sliding in grooves with pulleys. The great objection to this contrivance is the breaking of the sight line by a permanent obstruction, which renders the school useless for a large or public meeting—a system which we should strongly condemn. The invention to which we wish more particularly to call the attention of our readers is the improved folding partition, the sole makers of which are Messrs. Peace & Norquoy, of Port Street, Manchester. This partition is designed for dividing public buildings, schoolrooms,

warehouses, hotels, theatres, &c.; in fact, it seems to adapt itself to every place where a division of any kind is required—whether plain or artistic, wood or iron. No more schools need be cut up with brick or lath-and-plaster walls, or other primitive arrangement.

We take the following extract from the specification:—"This invention relates to the movable partitions or screens which are employed to screen off a portion of a room or to divide a large room into two or more smaller rooms, and are adapted to be moved when desirable, so as to give access from one division to another or to convert the two or more comparatively small rooms into a larger room. In the class of partition to which this invention relates, each partition is formed in sections or units, which are suspended and are adapted to be moved horizontally out of the way. The sections are suspended from carriages which run upon rails as usual, but in place of the sections being disconnected they are hinged together or the sections constituting the entire partition are divided into two or more sets, and the sections of each set hinged together. The sections are hinged together so that they can be folded one upon another similarly to an ordinary lap screen. When closing up the screen the outer meeting sections would be pushed away from each other right and left, and the sections would fold together. When thus folded the two parts of the partition would occupy comparatively small space. In some cases the partition would extend across the opening in one part, the said one part consisting of hinged sections. When the partition would be drawn out or pushed towards the side of the opening, the hinging together of the parts would insure parallelism of movement of the flaps composing the screen.

"The partitions are usually made in 2-inch panelled and moulded framing, with wood or glass panels, in sections about 3 feet 6 inches wide, hinged together with 3-inch steel back-flap hinges, and fixed in position with steel-faced flush bolts. Doors when required in partitions are hung with 4-inch steel butts, and fitted with rebated mortice lock and brass flush furniture. A groove is cut in the floor when fixing, and no previous preparation is necessary."

The inventors claim that this arrangement supersedes all other methods for dividing and subdividing rooms. By its means a large hall can be divided, or the partition, by an easy, gliding motion, folded back against the wall in two minutes, without leaving any obstruction on the floor. These partitions are being approved and specified by architects in the erection of new schools, and adopted by various School Boards.

HEWETSONS, Tottenham LONDON, W. Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely Furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

SURVEYORS, AUCTIONEERS AND VALUERS.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE annual dinner of the Leeds and Yorkshire Architectural Society was held on Monday night in the Queen's Hotel, Leeds. The chair was occupied by Mr. George Bertram Bulmer, the president. After dinner the Chairman referred to the demise of the late Mr. W. J. Mettam, who had acted as hon. secretary to the society. Mr. George Cobson proposed "The Army, Navy and Volunteers," and Colonel E. Wilson responded. "The City and Commerce of Leeds" was proposed by Mr. Leonard Cooper, and responded to by Alderman Hepworth, president of the Leeds Mechanics' Institute. The toast of "The Royal Institute of British Architects and the Allied Societies" was proposed by Mr. W. H. Thorp. He said the Institute and allied societies existed largely for the purpose of promoting intercourse between the various members of the profession, in bringing subjects of architectural interest before them by means of papers read at the meetings of the various societies. They also kept in view the education of the younger members of the profession. The Institute of British Architects might be looked upon in the light of a sort of university. It was not an educating body, but it was an examining body. Those examinations had been largely taken advantage of by the younger members of the profession. Mr. William Emerson replied in the first instance. He alluded specially to the meeting held in Liverpool, the outcome of which was the establishment of a scheme to assist young gentlemen who proposed to enter the profession, and who were situated at long distances from the large towns, and found difficulty in obtaining the means of study. The Institute and the allied societies now formed a centre for the purpose of supplying information to the younger students, and there was every hope that the effort would yield good fruit. At the present day the motto was "Union was strength"; but there was a certain number of professional men who, for some reason, held themselves aloof from their brethren, and indulged in gibes and sneers at them. Such conduct did not advance architecture or the profession of the architect. There were clergymen, too, who wrote for the ostensible purpose of educating the public, and in their writings showed how little they knew about the subject. Those things showed how much need there was for architects to unite to uphold the honour and dignity of their own profession. Mr. Edward Solomons said the idea the public had as to the means

the architect had at his disposal to produce the buildings he did was quite extraordinary. They must let the public know that there was something in the architect beyond the mere builder. It was said that the difference between the architect and the builder was that one carried a wooden two-foot rule and the other carried an ivory two-foot rule. If the public could be initiated into the mysteries of their profession it would do them good, and it would do good to the architects. Mr. Edward Mitchell-Gibbs said he was disappointed to find that so little had come of the proposal to establish a chair of architecture for the northern societies. In his opinion, the only way to meet the difficulty of the education of architects was to establish in some part of the country an architectural college, possibly in the northern district, by a combination of such provinces as Liverpool, Manchester, Leeds, Sheffield and Nottingham, all of which were within easy railway communication of each other. The Royal Institute should, as soon as it could, abandon its position as an examining body, and undertake the teaching of the architects of the country. To him there was nothing more painful in the present style of architecture than the want of proportion. Some architects did not seem to have the slightest notion of it. As an example of noble proportion, he cited the Leeds Town Hall, which, in his opinion, was one of the master productions of the present century—remarkable for its splendid outline and masterly restraint, a standing protest against the present style of architecture, with its affectation of irregularity and of plan. The toast was responded to by Mr. Alfred Henry Paget and Mr. Wm. Hepper. Mr. William Emerson proposed "The Leeds and Yorkshire Architectural Society." In the course of a short speech he expressed disapproval of Mr. Gibbs's suggestion that the Institute should be an educational body. It was, he thought, quite an unreasonable suggestion, and he was of opinion that the education of architects should take place before they had anything to do with the Royal Institute of British Architects. The Chairman alluded to the success which had attended the operations of the Society. It was established eighteen years ago, he said, by a band of young men who were desirous of improving the road along which they had to travel. The tide of success on which they flowed had been fed by the three streams of patience, perseverance and discretion. Their membership had been gradually increasing and it was now over a hundred. "Literature, Science and Art" was proposed by Canon Scott and responded to by Mr. J. J. Wilson and the Rev. J. H. Dudley Matthews.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street. Westminster, London.

The last toast was "Our Guests," proposed by Mr. E. J. Dodgshun and responded to by Mr. John Harrison, the town clerk.

PUBLIC WORKS AT HARROGATE.

AT the monthly meeting of the Town Council just held, the borough surveyor was instructed to prepare plans and estimates for the repurchase and laying out of a portion of the Crescent estate; for alterations and extension of the Victoria Baths; for new pump-room and improvements in the Boys' Fields; for additions on the Corporation Farm, street improvements, purchase of property in Robert Street, steam fire-engine and escape; alteration to market, &c., in respect of the application to the Local Government Board for sanction to loans. Out of forty-four applicants Mr. J. Dodsworth, London, was appointed assistant-surveyor. It was also decided to proceed with the erection of the Montpellier Baths forthwith at a cost not to exceed 65,000*l.*, and tenders accepted which amounted to 64,701*l.* 18*s* 5*d*. A building committee was appointed.

HEATING APPLIANCES.

THE night of Thursday, the 4th inst., and the following day will often be quoted by meteorologists as a sample of a sudden and severe set in of cold weather. The temperature in the southern portion of England averaged 20 degrees of frost, and in some suburban districts of London the thermometer showed 22 degrees of frost—that is, 10 degrees Fahrenheit above zero. During the past few years occasionally 17 degrees and 19 degrees of frost have been registered, but the late cold snap came with scarce any warning on householders, and the inconvenience experienced by "old Father Frost" cutting off the domestic supply of water has been felt by numbers. There are numerous systems, however, available for the general public to counteract the erratic changes of our climate, all good in their way. Offices, warehouses, public buildings, private houses, &c., that we visit are supplied with some system, or occasionally with only a makeshift system. Entering from the outer air, the excellence or defects of the heating agent is readily perceivable. With regard to hot-water apparatus, we should say, from experience of premises we have entered during cold weather, other systems may equal, but cannot certainly excel, the small-

bore tube and low-pressure system. The purity of the air, genial warmth, with entire absence of stuffiness, was remarkable, and though our visit to the premises in question had nothing to do with subjects of heating and ventilation, as a matter of curiosity information asked for as to the system used was forthwith afforded. It was the small-bore tube and low-pressure system. Mr. Saunders (S. Saunders, late J. McIntyre & Co.), 93 and 95 Upper Moss Lane, Hulme, Manchester, has been working very thoroughly in this particular system of heating apparatus, and by his years of experience has been able to afford valuable improvements on an already reliable system. Presuming that our readers are aware of the merits of the small-bore and low-pressure system, we would call attention to the great advantage obtained by the improved tubes—a manifest gain which will be appreciated by our readers and those of the public generally, who, if they would not care to be called experts, at any rate have convictions founded on experience. What should now also appeal to many is the expedient whereby the freezing of pipes is obviated. Saunders's improved tubular boiler is well worth calling attention to, one desideratum being obtained among others, viz. uniformity of heat. We would recommend our readers to apply to Mr. Saunders for his pamphlet and catalogue. Though the weight of the two combined is just below four ounces, the information given in the text is very useful. Moreover, as it is concise there is nothing redundant admitted to waste the reader's time or obscure the meaning of the compiler.

AT the meeting of the Literary and Philosophical Society, St. Andrews, N.B., Colonel Bailey delivered a lecture on "Forestry in Great Britain." He observed that Scotland had always taken the lead in this question. He showed that the continuance of our present supplies of timber from abroad could not be relied on, and urged that we should look to our home resources and plant up a portion of the land which is unsuited for agriculture. He alluded to the recent revision by the Board of Agriculture of the orders relating to the use of home-grown timber in the erection of buildings under the Land Improvement Act, and to the facilities now afforded for the planting of trees under the provisions of that Act. He spoke of the recent storm, and explained how the effects of such storms might to some extent be modified. He concluded with some remarks on the effects of growing timber in open woods.

SOCIETY OF ARTS.

THE ordinary meetings of the Society of Arts will recommence after the Christmas recess on Wednesday evening, the 17th inst., when Mr. A. P. Laurie will read a paper on "White Lead Substitutes." The arrangements for the succeeding Wednesdays are as follows:—January 24, "American Carriages," by Mr. G. Herbert Thrupp; January 31, "Californian Wines," by Mr. Charles P. Oldham; February 7, "Reproduction of Colours by Photography," by Captain Abney; February 14, "The St. Pancras Electric Light Installation," by Mr. Henry Robinson; February 21, "Electric Signalling without Wires," by Mr. W. H. Preece. The next course of Cantor lectures will be delivered on Monday evenings, January 22, 29, and February 5, 12, by Professor Frank Clowes, the subject being "The Detection and Measurement of Inflammable Gas and Vapour in the Air." Mr. Hugh Stannus will give a course of Cantor lectures on "The Decorative Treatment of Traditional Foliage," on February 19, 26, and March 5, 12. Further Cantor lectures will be delivered by Captain Abney on "Photometry," and by Mr. H. C. Jenkins on "Typewriting Machines."

THE HEIGHTS OF CORNER BUILDINGS.

IN obedience to another summons, Messrs. Lawrance & Co., who erected the block of buildings at the junction of the Kensington Road with Kensington Court, appeared at the West London Police Court on Tuesday. The alleged offence was the old one of exceeding the prescribed rules about height without the consent in writing of the London County Council. Originally the magistrate held that the building was in Kensington Road, and dismissed the summons. A case was taken to the High Court, where the judges expressed an adverse opinion, and held that the building was in Kensington Court, a new street of less width than 50 feet. The magistrate reheard the summons, and imposed a penalty with costs, at the same time stating that if there were any future proceedings a fine of the smallest coin in the realm would be sufficient. The summons heard on Tuesday was taken out by the London County Council. Mr. Horace Avory, who supported it, stated that the building was 75 feet in height. It was a serious matter to the Council, who had instructed him to press the magistrate to enforce the Act to the fullest extent, as it was

probable that the parties were prepared to pay the penalties rather than comply with it, because it suited their pockets better. There was a penalty of 5*l.* with a continuing penalty of 40*s.* a day. There was no other remedy and no power to order the building to be pulled down. He submitted that the defendant was liable to the continuing penalties since October 15, 1892. Mr. Poole, on behalf of the defendant, argued that a builder was not liable to the continuing penalties after he had given up the building. It was given up by the defendant in February of last year, and the London County Council was acquainted with the name of the owner, but they thought it wise to go against the builder. He pointed out that it was a *bona fide* mistake, it being the first case under the Act. Mr. Horace Avory, in reply, said the person who committed the offence was liable. Mr. Curtis Bennett suggested that the defendant would have no power to pull the building down now that he had given it up. Mr. Horace Avory: He should not have put it up. In the course of the arguments, Mr. Poole said a penal notice had been served on the owner, and therefore it was likely that other proceedings would be heard at that Court. Mr. Curtis Bennett in the end adjourned the summons *sine die*.

THE TOWER BRIDGE.

A REPORT has been prepared by Colonel Haywood, the engineer to the City Commissioner of Sewers, on the references as to the sufficiency of the northern and north-western approaches of the Tower Bridge, and the desirability of acquiring ground on the site rendered vacant recently by the fire in St. Mary Axe, with the view to forming a new street in that direction. He states that with regard to a new western or north-western street from the Tower Bridge, he is of opinion that a large portion of the traffic which will cross the new bridge will be that which goes between the south-east and north-east of the metropolis, avoiding the City altogether, and thus relieving London Bridge, Gracechurch Street and Bishopsgate Street, as well as Fenchurch Street, Eastcheap, Great Tower Street and Lower Thames Street. Some carriage traffic which crossed the Tower Bridge would, however, turn westwards into the City, and it was therefore necessary to consider what were the existing streets which would accommodate that traffic. As to Lower Thames Street, Tower Street

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4 brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

and Eastcheap, vehicles could pass by way of Postern Row and Tower Hill, and by the same line traffic could reach Crutched Friars by way of Trinity Square. Crutched Friars could also be approached by the Minorities and John Street, both of such ample width that double the present traffic passing along them could be accommodated. Fenchurch Street and Liverpool Street might be reached by the Minorities or by John Street and Jewry Street. Traffic going more northwards could do so by the Minorities and Houndsditch, which lead to Bishopsgate Street and Liverpool Street, and also by Duke Street, Bevis Marks and Camomile Street, which in recent years have been connected and widened by the Commission. The traffic in Aldgate between Fenchurch Street and the Minorities is no doubt frequently impeded, but that could only be cured by a very extensive improvement or by the formation of a new street running from Holborn right through the City north of the Bank. With these existing thoroughfares it appeared to Colonel Haywood somewhat premature to enter on the consideration of a new line of western streets from the Tower Bridge. When the bridge has been open for two or three years the extent and direction of the traffic would be ascertained, and it would be seen whether a new street was wanted or not. No doubt a street leading in a north-west direction would be of advantage, but the same remark would apply to a new street to be formed in any part of the City; nor did it follow that a new western approach street, if needed, should take the direction of the ground in St. Mary Axe recently made vacant by the fire.

THE MANCHESTER GASWORKS.

THE members of the Gas Committee of the Manchester Corporation paid a visit of inspection to the gas station in Bradford Road on Monday. The Gas Committee, it may be remembered, says the *Manchester Guardian*, recently obtained from the Local Government Board power to borrow the sum of 500,000*l.* for gasworks purposes, and of this sum it is proposed to devote to the Bradford Road station something like 114,000*l.* Inclusive of the land already built upon, the Corporation have at Bradford Road about 52 acres of land. At the time the purchase was made there were many members of the Council both in and out of the Gas Committee who doubted the wisdom of it, but now it is pretty generally agreed that the transaction has proved highly advantageous to the Corporation and the

ratepayers. While the station at Rochdale Road is crowded with buildings and apparatus in a way that is, to say the least, very inconvenient, there is land enough and to spare at Bradford Road for such extensions as the increased consumption of gas may from time to time render necessary. According to the books of the Corporation the value of the Bradford Road station at the close of the last financial year was as follows, viz. :—Land, 124,963*l.*; buildings, 128,410*l.*; apparatus, 184,678*l.*; total, 438,051*l.* When the extensions now in progress and in contemplation are completed the value will, of course, be considerably increased. The extensions will bring the productive power of the station up to 8,500,000 cubic feet of gas per day, and by the erection of one additional gasholder, the largest out of London, the storage capacity will be increased from 6,000,000 to 13,000,000 cubic feet. With these and other additions the gas-making capacity of the whole of the city gasworks will be increased to 21,000,000 cubic feet and the storage capacity to 25,000,000 cubic feet.

The principal object of this visit was to inspect the stoking machinery which has been erected at the works by West's Gas Improvement Company, Limited, of Miles Platting. With the view of securing the latest and most improved machinery for stoking purposes, the Gas Committee some time ago visited the South Metropolitan Gasworks in London and other leading gasworks in the country, and as a result of their inquiries and deliberations they decided to adopt the complete plant of the West Company for one of the large retort-houses. The apparatus does not merely take the place of the hand stokers, as its name suggests, but brings the coal and cannel from the stores, breaks the material up into small pieces by four powerful machines each driven by a steam-engine, and by an ingenious automatic arrangement conveys it into the retort-house, where it charges the retorts in such a way as to secure the best result in the form of a large yield of gas. The machinery is worked by compressed air supplied by a stationary air compressor, in which there are many novel features. It is said that the total cost of the machinery is about 8,000*l.*, and if the expectations of the makers are realised this amount will be saved within the first year the machinery is in operation through the economies that will be effected. Seen in operation, it appeared to work with remarkable smoothness and efficiency. Its adoption will displace a considerable amount of manual labour, and it is satisfactory to learn that the workmen have taken to it in a friendly spirit and with every disposition to work it as well as they can.

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

At the meeting of this Society on Thursday, the 4th inst., Mr. R. Nelson Boyd, M.I.C.E., F.G.S., &c., read a paper. After alluding to the formation of peat in nature, its origin, localities and characteristics, the author referred to its anti-septic qualities, and the valuable products obtained from it by destructive distillation. Its great value, however, lay in the possibility of converting it into a useful fuel. The author then described some of the machinery in use for preparing peat for fuel in different countries, and mentioned the reports made on the value of peat to Government in this country, as well as the result obtained in practical experiments on railways and steamers. Having given various analyses of peat and its products, the author described the system invented by Mr. Blunden, by which the peat is forced out of the machines used in the form of thick drain tiles or tubes. Mr. Blunden's general process was then described and the cost of his plant stated. The economic value of peat was considered, first as a fuel, secondly as to the products from it by distillation, and, thirdly, as to the coke or charcoal produced. At present the two latter have a value in the markets, as the distillation produces a fair amount of sulphate of ammonia, and the coke or charcoal has a special value owing to its freedom from impurities. It was also pointed out that eventually the large deposits of peat will have a greater value as the cost of coal increases, which it must do in course of time.

BUSINESS PREMISES, EDINBURGH.

AN excellent start has now been made with the building of the new business premises for Messrs. Charles Jenner & Co. at the corner of Princes Street and South St. David Street. The builders are already considerably above the street level with the outer walls, and the handsome polished granite pillars which form the supports of the imposing arcading of the windows, both on the south and east fronts, give already some indication of the character of the edifice which is to be reared on this prominent site. The architects have designed the building in a free Renaissance style, partaking both of the characteristics of the Jacobean architecture of England as practised by Inigo Jones and Wren, and also of the French Renaissance of the Valley of the Loire. The most striking features of the design are the shop arcading and a great octagon tower at the angle of Princes Street and St. David

Street. The arches of the shop arcade rise to a height of 22 feet above the pavement of Princes Street and on that frontage of 80 feet there are six bays. On St. David Street there are twelve bays, and the arcade becomes lower in consequence of the rise in the street northwards. The shop-windows are recessed 2 feet between the piers of the arcade, so that those looking into them may do so without being jostled by the passing traffic. The pier bases are of dark blue granite, simply moulded, and the piers themselves consist of large blocks of rich red Aberdeen granite from the Hill o' Fare Quarry, all beautifully polished. The pier capitals and the arches are in yellow freestone from Craggs Quarry, Northumberland, and are handsomely moulded and carved in the style of the building. The main doorways from Princes Street and St. David Street have deeply-recessed porches floored and lined with marble and granite, and the exteriors are pedimented and carved. The angle tower rises to a height of 120 feet above Princes Street, and is decorated with statuary upon the first and fifth floors. The second, third and fourth floors have the Orders of architecture and projecting balconies and panellings richly carved, and the tower is finished off with flying buttresses, arcaded windows, carved parapets and a stately tourelle at the north-east corner, by which access is obtained to the platform roof and flagstaff. The late Mr. Jenner, it may be recalled, bequeathed a sum of 8,000*l.* to his trustees for the purpose of suitably embellishing the exterior of the new building. It was to be a free gift, and not to be taken into account in the value of the property. He also desired the introduction of caryatides or female figures into the scheme of decoration, to show symbolically that women are the support of the house, and these injunctions the trustees are now taking steps to have carried into effect. It might also be mentioned here in connection with the description of the exterior of the elevation that, at Mr. Jenner's request, the Jacobean features introduced into the elevation have been studied by the architects from the Bodleian Tower, Oxford, a beautiful masterpiece by Inigo Jones, which Mr. Jenner saw and admired when on a visit to that city more than twenty years ago. The building throughout will be entirely fireproof. In the construction of the walls brick has been largely used in preference to stone; all the internal beams and standards carrying the various doors and roofs are of the best steel, and the floors themselves are of Portland cement concrete, faced with either marble or wood-block paving. The roofs are also of steel and concrete, covered externally with slates or Val de

Travers asphalt. Further, in pursuance of the same fireproof scheme, the building is divided into a Princes Street and a St. David Street block, separated from foundation to roof by a thick fireproof wall, all the openings in which are protected by fireproof doors. The staircases are also of fireproof material, those within the business premises being covered with marble, and those for the upper floors with red concrete. The Princes Street block contains a shop, 80 feet by 70 feet and 24 feet high, with a basement flat below of considerably larger size, as it extends outwards below Princes Street and St. David Street. The basement is excavated 13 feet below the street level, and is lined throughout with enamelled brickwork in harmonious shades of colour. On the west side of the shop there is a gallery floor, containing restaurant, reading-room, writing-room, parcel office, telephone-box and lavatories for the exclusive use of the firm's customers. On east side of shop there is a similar gallery floor, containing the counting-room and the partners' private rooms. The first and second floors of the Princes Street block are extensive warerooms, while the three upper floors are occupied as the assistants' boarding establishment and workrooms. The St. David Street block contains a shop fronting that street, 90 feet by 40 feet; a central hall, 90 feet by 37 feet; and a back wareroom, 82 feet by 20 feet. The central hall rises to a height of 60 feet, and has two tiers of galleries, giving access through handsome arcading to the first and second floor ware-rooms of this block. There is a grand staircase at the north end of the central hall, and the various floors of the shop, warerooms and workrooms are connected by four elevators, of which two will be used by customers and two by the employes. In addition, there will be a powerful hydraulic platform lift for taking in heavy goods from Rose Street, and a hydraulic crane for taking furniture to the upholstery department. The four upper floors of the St. David Street block will be occupied as the assistants' boarding establishment, while the Rose Street block to the back will be occupied as workrooms. The whole establishment will be lit with the electric light, and will be heated and ventilated upon a general system, under which it is anticipated that not only will warm fresh air be supplied in winter, but that fresh air artificially cooled will be supplied to the warerooms and workrooms during hot summer weather. The architects for the new building are Messrs. George Beattie & Son, Edinburgh. The contractors for the mason and brick-work are Messrs. James Young & Son, Polwarth Terrace; the steelwork, Messrs. Mather & Son, Fountainbridge; the fire-proof work, Stuart's Granolithic Company, London; the granite

work, Mr. Wm. Keith, jun., of Aberdeen. The other contracts are not yet settled. If the winter is a reasonably open one, it is anticipated that Messrs. Jenner & Co. may be in possession of their shop premises before the end of 1894.

MUNICIPAL UNDERTAKINGS IN LEEDS.

NOWHERE in the county, says the *Leeds Mercury*, is the future being more confidently anticipated than in its chief industrial centre. The remarkable growth of Leeds during the last thirty or forty years still characterises the city. Even in the darkest hour of the recent depression expansion was manifest, and, as in former periods of adversity, Leeds has suffered less than perhaps any other part of the country. Everything seems to indicate that the city is destined to hold its present position among the great towns, advance as they may, if not to take a higher one. Such being the case, the Corporation cannot, if it would, fold its arms. On the contrary, strenuous efforts are demanded of it. The remarkable development has exceeded its powers of achievement, and it has considerable work to do ere it can say that the altered conditions are fulfilled. The task requires keen appreciation of public needs, and the difficulty is all the greater because what will suffice to-day will, in all probability, be totally inadequate a short time hence. Improvements, if they are wisely designed, must therefore be carried out on a comprehensive scale. They are of two kinds—those required in the interests of health, and those which must be made if the Corporation is to facilitate and direct the development which comes from industry, enterprise, advantageous situation and the like. Neglect with reference to the principal thoroughfares has made the burden of to-day much heavier than it would have been otherwise. The city fathers in the past were easy-going men. What was probably less to their discredit, they did not foresee that almost within the span of a life their big village would become a great city. On no other ground can one account for so many narrow, irregular thoroughfares, and the absence, amongst the older ones, of anything stately and gratifying to the eye. The children must atone for the shortcomings of the fathers, and one of several important works which the Corporation is taking up is the widening of some half-dozen of the chief arteries of the city. These are Duncan Street, Vicar Lane, North Street, Meadow Lane, Park Lane and Lands Lane. The last-mentioned, which has been in hand a long time, is

partly done. There are many other improvements of a like character which might have been more advantageously carried out, but if only for the sake of obliterating a piece of patch-work, which has entailed a considerable outlay that is yielding no adequate return, and which is satisfactory from no other point of view, the widening of the street ought to be finished without further delay. The tinkering in Lands Lane will have been of some good, however, if it convinces the Corporation of the folly of such a policy. The North Street, Vicar Lane and Duncan Street widenings are essential to a good tramway service. That is to say, the cars ought to enter the city from the Chapel Town and Meanwood sections by that route, and leave by way of Briggate. There are other considerations, such as the extension of the markets at some future time and the clearance of insanitary property in the district, which it may also be well to bear in mind in connection with this most important part of the street projects. All these may not be commenced during the year. There is, no doubt, much to be said in justification of the policy. If expectations are realised a good deal of work will be begun almost immediately.

Then there is the laying out of City Square, in front of the new General Post Office. The year should see that accomplished, though nothing has yet been decided as to how it is to be done. It is intended to cut off the wedge-shaped corner of Wellington Street and Quebec Street, so as to open out the square to Aire Street, and probably that will precede the laying out, though it need not necessarily do so.

The overhauling of the tramways will form an important part of the work of the Corporation during the year. The transfer of the undertaking, now that an agreement between the Corporation and the Tramways Company has been effected, cannot be much longer delayed. Then will commence, no doubt, the relaying of the sixteen miles of the track. The system of traction to be adopted is still under consideration. It is almost safe to say, however, that electricity will be the motive power, and if so, that will entail the early erection of the station and the laying down of the necessary plant. It is difficult to conceive of anything which will contribute more effectively to the development of the city than a well-organised tramway system. During many years no project has more thoroughly tested the business capability of the Corporation than this one will do, and it is encouraging to find that the character of the enterprise is being recognised.

The schemes already noticed would be a sufficient tax upon the energy and judgment of the city fathers, but there are

other and no less important duties to which they must as promptly give attention. The West Riding Conservancy Board intends to discharge its responsibilities, which means that every city, town and village that has hitherto been polluting the rivers and other watercourses of the Riding will have to cease doing so. This alone will account for no small part of the present activity of the sanitary authorities, and the enforcement of the law relating to the matter will undoubtedly entail a very large expenditure throughout the Riding. In Leeds more extensive sewage works must be provided. It is intended to have a sewage farm at Rodley, and the main sewers on that side of the borough will have to be carried thither. This will obviate the fouling of the canal in that district, which the Canal Company are not disposed longer to tolerate. But the Rodley Farm will not nearly meet the requirements. It will only take the sewage of about 20,000 inhabitants—a mere drop in the bucket. How is the remainder of the sewage of the city, whose population is fast approaching 400,000, to be dealt with? It is no secret that the works at Knostrop are insufficient. And this is not the gravest part of the situation. Any scheme of sewage purification adopted must be such as will meet the requirements of Leeds when its population is much larger than at present, for, as will be readily understood, land in the district suitable for the purpose is a rapidly declining quantity. It is extremely doubtful whether it would be wise to extend the Knostrop works. What has happened again and again when the river was in high flood indicates that their location is not a good one. The matter is now under consideration, and we shall doubtless learn more about it before long, for it is one that cannot be deferred. It may be assumed, however, that the carrying out of any adequate scheme, whether for the treatment of the sewage on the Knostrop system, or on some extensive tract of agricultural land at a distance, will entail a very large expenditure.

Some extensions of the waterworks must also be undertaken in order to make provision for the increasing requirements of the city. The construction of one of the large service reservoirs projected some time ago will in all probability be undertaken during the year. This will be situated at Harehills, opposite the Gipton Inn. Plans and estimates for it are about to be submitted to the Waterworks Committee. The repair of Eccup reservoir is still affording work for several hundreds of men, and a year or two more must elapse ere the engineering mistake in the construction is remedied. It will thus be seen that the Leeds Corporation has its hands full.

THE SCOTTISH PIG-IRON TRADE.

IN their annual report on the pig-iron trade, Messrs. William Jacks & Co. write :—For the year which has just opened, the prospects of the pig-iron trade do not seem to us to be particularly bright. Scotch warrants are again in a somewhat abnormal position. Just before the coal strike in the Midlands began, two or three operators bought large quantities of Scotch warrants in the expectation, it is supposed, that the outbreak of the strike would be followed by an advance in price. This expectation was not realised, but the holders have since supported the market by adding continually to their purchases, with the result that while Cleveland and hematite stand at exactly the same as at the commencement of the strike, Scotch warrants are more than a shilling higher. In consequence of this Scotch warrants have become too dear to be employed by consumers, as is proved by the fact that though since the Midland strike began, nearly six months ago, no G.M.B. iron has been made in Scotland, yet the total withdrawals during these months from Connal's stores have amounted only to about 15,000 tons, and of this a very large portion was not, properly speaking, G.M.B. iron at all, but consisted of Carnbroe, Almond, and one or two other superior brands, of which only a few thousand tons altogether now remain in store. Scotch warrants are, in fact, now in exactly the same position in which they stood when the London syndicate maintained the price for so many months at 47s., for though the actual price is lower the relative price, compared, that is, with Cleveland and hematite, is higher now than then; and it seems obvious that Scotch warrants can have no interest except as speculative factors until either Cleveland and hematite have advanced or Scotch have fallen to a figure which will enable the iron to come again into consumption. Leaving, however, the special position of Scotch warrants out of view, what is the outlook for the pig-iron trade as a whole? During the last month or two a more hopeful feeling has sprung up in regard to the future of pig-iron prices; but this feeling is based not so much upon any belief that trade is improving—for statistics seem to show that business in all branches of the iron trade is still unfortunately contracting rather than expanding—as upon the hope that higher prices may be expected on account of, first, the cost of production, and second, the smallness of the stocks.

1. The high cost of production, when, as is the case at present, it is sufficiently serious to limit the make, has undoubtedly a most important effect upon prices; but it must

not be forgotten that the high price of coal, while it tends to diminish the production, tends at the same time, and in at least an equal degree, to diminish the consumption of pig-iron. In illustration of this we would point to the present position of the steel trade. The price of steel for shipbuilding is now about 7s. 6d. per ton cheaper than in 1886, the year when prices were at the lowest point which, before the present period of depression began, had ever been touched; but in 1886 hematite was being delivered at the Scotch steel works at from 5s. to 6s. per ton cheaper than the present price. Serious, therefore, as the high cost of production is for the ironmaster, it is still more serious for the steelmaker, who suffers in an equal degree from the dearthness of coal, and is at the same time handicapped by the very high price which, in comparison with what he can get for his steel, he has to pay for his pig-iron. It is not, however, by diminishing the home consumption only that the high cost of production adversely affects the demand for pig-iron. The present prices of British pig-iron, though in themselves moderate, are very high when compared with the prices of German, French and Belgian irons, which compete with us on the Continent, and therefore until our prices fall, or the prices of our competitors materially advance, we can hardly look for any improvement in the foreign demand.

2. The smallness of stocks, it seems to us, is scarcely an argument in favour of an advance in price. It is rather a ground for expecting that when an advance does take place it will be both rapid and important. So long as the production of pig-iron equals the consumption, the surplus stock is not required, and it is of comparatively little importance whether it be small or large. In estimating, therefore, the extent to which prices are likely to be influenced by the smallness of the stock, the important thing to consider is whether the stock will probably increase or diminish; and, looked at from that point of view, we must say that we can see no reason for expecting that the stock of pig-iron during the coming year will grow smaller. Last year, in spite of the strikes which so seriously interfered with the production, the stock of pig-iron in the three districts—Cleveland, Scotland and Cumberland—combined increased to the extent of 108,000 tons, without taking into account the increase, which must have been very considerable, in the stock of the hematite in the Cleveland district, as well as in the Cumberland rail works, and during the coming year we see nothing to prevent that increase from continuing. Of course, we quite realise that the position often

changes very quickly, and if trade were to improve, the smallness of the stocks, both in the public stores and in the consumers' yards, would do much to cause a rapid advance; but, as far as we can judge them, the present indications do not point to an early revival in trade, and we fear it will be some time yet before we come to an end of the present period of depression.

Messrs. R. Feldtmann & Co. write:—The year which has just closed ranks among the most unfavourable in the commercial history of this country, and will be a memorable one from the numerous causes which have contributed to aggravate the already existing severe strain of depression in almost every branch of business. The financial panic in Australia, the silver crisis in the United States, the continued "money famine" in the South American Republics, the intestine war in Brazil, and last, but not least, the numerous and determined struggles between capital and labour in the coal trade of this country, entailing losses, suffering and dislocation of all our staple trades—all these have had a most serious effect on the commerce of the country, and more particularly on the iron and steel trade. The latter is not only one of the most important of our industries, but also one of the most sensitive to external influences—the first to grow and develop in the sunshine of prosperity; the first likewise to wither and droop on the approach of clouds of adversity. But there are still other causes which have militated against our trade; the large market we used to find for our iron products in the United States is now, except under abnormal conditions, practically closed to us, as, fostered by protective tariffs, the Americans have largely developed their own vast natural resources of coal and iron, and are now able to fully supply their own wants. On the continent of Europe, too, our markets have been considerably curtailed by high protective tariffs, which, however onerous to the countries choosing to tax themselves thus, have enabled them at least to build up big iron and steel industries, capable of not only supplying their own requirements, but even of sending some of their surplus manufactures to our markets, and, as a consequence, seriously injuring our export trade in these materials. The closing of so many of our old outlets has not yet been counterbalanced by the opening up of new markets on a large scale, and, as a result, all classes of the community are at present suffering. Having nothing to offer foreign nations as a *quid pro quo* for a reduction of their import duties, our hope of commercial salvation must lie principally in the development of railway construction in

India, Burmah and South Africa, especially the latter. The main feature in favour of the iron trade at present is that stocks are low and prices moderate, so that we may confidently look for an immediate favourable influence on our market when the first promising symptoms of revival appear.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 24825. George Oulton, for "Improvements in or connected with nozzles and valves."
- 24828. Alfred Lovekin, trading as Rea & Neale, for "An improved spanner or wrench."
- 24832. Thomas Garforth Rhodes, Fred Rawson and Raymond Gaunt, for "An improved valveless syphon for draining cisterns, tanks and the like."
- 24834. Richard Leopold Kirelew, for "Flues, ventilating and chimney shafts."
- 24852. Mark Bartlett, for "Improvements in grates of register stoves and other stoves."
- 24887. Honor Georgina Basset, for "Improved measuring device or gauge."
- 24971. Ernest Gilby Allison, for "An automatic closing and retaining valve."
- 24981. Thomas Saunders and Thomas Haddon, for "Improvements in the construction of lock and latch staples."
- 25037. Thomas Downie, for "Improvements applicable to window-sashes."

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 209.
Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

Henry Willcock, Wolverhampton	£4,985	0	0
---	--------	---	---

ELECTRICAL.

At the meeting of the Southampton Harbour Board it was reported that the two electric cranes now being fitted on the Town Quay were completed, and had stood all tests. These are the first of the kind ever erected in any part of this country, and are an improvement on those now in use at Hamburg. The total cost of the cranes amounts to 2,480*l*. It was unanimously agreed to light the Town Quay and offices with electricity instead of gas, as at present.

THE sub-committee of the Edinburgh Town Council in charge of the matter of electric lighting in the city have accepted an estimate for the removal of the buildings on the site of the proposed supply station to be erected at Torphichen Street, and generally approved of the plans for the station submitted by the burgh engineer. The plans show a building of considerable extent in the Renaissance style of architecture, so far ornate as considerations of economy will allow.

TRADE NOTES.

THREE tenders have been received by the Sedbergh Rural Sanitary Authority for the construction of outfall sewers and sewage-disposal works at Sedbergh, in Yorkshire. The tender of Messrs. Brassingham Bros. & Carney, of Settle, in Yorkshire, amounting to 1,973*l*., has been accepted. The works consist of a small sewage farm and outfall sewers following the contours of the hilly ground. Several brooks and springs which entered the old sewers are to be disconnected from the system, so as to reduce the quantity of sewage to a minimum. The engineer to the works is Mr. W. H. Radford, C.E., of Nottingham, and his estimate was 2,478*l* 8*s*., so that there has been a considerable saving on the estimate.

THE Kilmarnock Water Committee have been empowered to accept offers for the laying of piping in connection with extensions, and to borrow 10,000*l*. to carry out the work.

AT the municipal meeting, Dunblane, a correspondence was read between the engineer and the contractor for the drainage, the contractor claiming 4,551*l*., while the engineer would only certify for 4,087*l*. Rather than go to arbitration the Commission agreed to offer 125*l*. above the engineer's statement, but it was to be without prejudice.

VARIETIES.

WE have received from the Rugby Portland Cement Company a calendar mounted on a large card in bold style, which should prove useful for hanging on office walls. Each monthly sheet has on the reverse side a calendar for the whole year of 1894 and also 1895, with postal information in addition. There are also several pages of "Facts in regard to the use of Portland Cement worth Keeping." The card on which the calendar is mounted gives ten views, showing a general view of the works, parts of the quarry, working operations, laboratory, test room, kilns and their working, pump houses and inclined tram line, fitters' shop and a general view of the quarry. The geological section across the country from Holyhead to Dover is also delineated.

THE *Leeds Mercury* says:—Under the grant of the Leeds City Council for technical instruction, arrangements have been made for two courses of four lectures, each to be delivered in the Fine Art Gallery, on Thursday evenings, from January 18

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving.

"ECLIPSE" PORTLAND CEMENT. Quick-setting; test, 3 parts. Standard Testing Sand, 250 lbs. per square inch. 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

Specially adapted for laying encaustic tiles, making joints in sanitary pipes, internal stucco, concrete foundations, &c.

Samples sufficient for Practical Tests Free. Manufactured by JOHN BOARD & CO., Dunball, Bridgwater.

ESTABLISHED 1844.

JOEL & CO.

31 Wilson St., Finsbury Square, London, E.C.

to March 8. The first course, commencing on January 18, will be given by Dr. J. B. Cohen, of the Yorkshire College, on "The Air of Towns," and will comprise (1) close rooms; (2) smoke; (3) town fog; (4) the germs of the air. The second course, commencing February 15, will be delivered by Mr. Frank Suddards, also of the Yorkshire College, on "Pictorial Art," comprising (1) pictures, and how to understand them; (2) characteristics of modern art; (3) the influence of nature on art; (4) mural pictures and fresco paintings.

THE building of the great tower at Wembley Park, London, is so far advanced that the legs of the structure are now finished, and the steel work rises to a height of 150 feet. It is hoped that the tower will be completed in the coming spring.

The Wembley Tower is, however, to have a competitor in a gigantic wheel and towers, after the Chicago model, at Earl's Court. Messrs. Maudslay, Son & Field, of the Westminster Bridge Road, are the engineers. The wheel will be 300 feet high, and have attached to its circumference forty passenger carriages, each to hold forty persons. The four steel column supports will have eight platforms, fitted with restaurants, dining halls and ball-rooms. The Chicago wheel, made in twenty weeks, cost over 140,000*l*.

THE Harrogate Town Council have decided to spend 63,000*l*. in the erection of a grand bathing establishment, winter-gardens, pump-rooms, &c. In addition, 8,000*l*. is to be spent upon the repurchase and the laying-out of the Crescent Estate and improvements at the Victoria Baths; 3,000*l*. for house, greenhouse and improvements to the Bog Valley Gardens; 2,500*l*. for farmhouse and works on the Corporation farm; 2,500*l*. for street improvements, 3,000*l*. for purchase and provision of a town's yard; 250*l*. for a public lavatory, 1,000*l*. for sanatorium, 700*l*. for steam fire-engine and fire-escape, and 700*l*. for alterations at the market. Altogether, a total of 110,000*l*. will have to be provided in the next four or five years.

THE Manchester Corporation are seeking powers to borrow 250,000*l*. for the purpose of extending the gasworks of the city, and a Local Government Board inquiry has been held with respect to the matter. The Lord Mayor mentioned that the Corporation had spent 2,000,000*l*. on Thirlmere Waterworks and 750,000*l*. on sewerage works, and over and above this had lent 5,000,000*l*. to the Ship Canal Company.

In connection with the Aberdeen University extension the City Chamberlain (Mr. P. M. Cran) has received a cheque for

12,000*l*. as the instalment for 1893 of the Government grant of 40,000*l*. towards the cost of the university extension. It is intimated that the contribution for this year will be 10,000*l*. Dr. Mitchell, Newcastle, has sent a further instalment of 2,000*l*., making 7,000*l*. paid of his subscription.

AT the meeting of the Edinburgh Merchants' Association the proposal that a ship canal should be constructed between the Forth and the Clyde was revived.

THERE is a movement on foot at Bangor for the construction of a pier, and a meeting of ratepayers has been held in the Penryn Hall to discuss the desirability of promoting a Parliamentary bill for the purpose.

AN inquiry by the Local Government Board has been opened at Hanwell with reference to an application by the urban authorities of Acton, Chiswick and Hanwell for the provision of an isolation hospital. As it is proposed that the site should be in Perivale, one of the most picturesque hamlets in the vale of Middlesex, the scheme is opposed.

AT the meeting of the Leamington School Board a letter was read from Mr. T. G. Cundall, architect, requesting that the preparation of the building plans for the proposed new schools might be thrown open for competition amongst local architects, and not confined to one, as heretofore. The clerk explained that the proposed schools would be the completion of a block of which the plans had already been drawn. The chairman suggested that in future the Board might give other architects an opportunity of competing for the preparation of these plans.

AT a meeting of the Glasgow University Court it was announced that the Bellahouston trustees had resolved to grant 10,000*l*. for the erection and equipment of a laboratory for the chair of engineering on condition that a like sum is obtained from other sources, or if a larger sum be raised the trustees would contribute a similar proportion, the total contribution not, however, to exceed 12,500*l*. The trustees would also give 5,000*l*. for the erection of a classroom and laboratory for the chair of botany.

THE Vestry of St. George, Hanover Square, have just opened to the public the new sanitary building which they have erected in Hyde Park, on the edge of the park close to the Marble Arch. It is of handsome design, and the various fittings appear to be as perfect as they can be made. With tiled walls and floor, stained-glass windows, and both gas and electric light, the interior is decidedly cheerful. Hot and cold

water will be found in the lavatories. The work has been carried out by Messrs. Bywater from the plans of Mr. George Livingstone, C.E., surveyor to the vestry.

THE Walsall Board of Guardians have adopted a report of their Building Committee, recommending the erection of an infirmary at the rear of the workhouse to accommodate 120 patients—60 males and 60 females—in four wards, the buildings to be of a plain and unpretentious character, but of the best materials, and plans and specifications to be obtained by open competition.

At the meeting of the Prescot Board of Guardians, the Building Committee pointed out that further accommodation at the workhouse was absolutely and urgently needed, and suggested that the necessary steps should be taken for the accommodation of about 250 additional cases by building upon the land adjoining the workhouse, and that plans be drawn so as to provide for any further extension as may be necessary in future. The architect had submitted plans showing schemes for both hospital and ordinary workhouse accommodation to the committee.

THE report that Boxhill is in danger of falling into the hands of the speculative builder is, it is stated, arousing the keen attention of the Mid-Surrey residents, and particularly of the members of the Dorking Town Improvement Association, recently formed to make more widely known the beauties of this practically suburban town.

BUILDING AND BUILDERS.

THE Royal Liverpool Golf Club have decided to erect new club buildings on the Hoylake links at a cost of about 8,000l.

CONTRACTS have been entered into for the erection of a large new distillery adjoining the Muirtown Wharf, Inverness. The new distillery, which is to be known as the Glen Mor, will be fitted up with the most improved appliances.

AN offer has been made by the London and North-Western Railway Company to give a site for the erection of a Cottage Hospital, near the Queen's Park, Crewe, which the company previously gave to the town in the Jubilee year. Mr. F. W. Webb (chief mechanical engineer at Crewe) has intimated his willingness to give 1,000l. towards the erection of the buildings, and two further sums of 1,000l. each are promised.

SHEFFIELD SOCIETY OF ARCHITECTS.

THE ordinary monthly meeting of the Society was held at the School of Art on Tuesday evening, the 16th inst. Mr. E. M. Gibbs presided, and there was a good attendance. A paper was read by Mr. H. W. Lockwood on "Symbolic Architecture," which was of a light and amusing character, and in which no attempt was made to trace symbolic forms to their origin, this more serious treatment being reserved for a future occasion. The writer, taking some of the most recent and best-known architectural works in the city, attempted to deduce from their design evidence of symbolic intentions on the part of their designers. The line of argument pursued was ingenious and interesting, especially to those present whose works were used for illustration. In conclusion, it was urged that, to be thoroughly successful, a building should by its design tell the beholder for what purpose it was designed. From the discussion which followed, it transpired that the symbolism discovered in the buildings had had no existence in the minds of the designers. On the motion of Mr. J. Smith and Mr. T. Winder, a vote of thanks was accorded to the writer of the paper.

The President announced that lectures had been promised by Professor Ripper, of the Technical School, on "Tests of Materials," and by Mr. Johnson, of the Electric Lighting Company, and by Mr. J. Smith.

SEWAGE DISPOSAL.

A MEETING was held in the Town Hall, Ripon, to hear the first of a course of four lectures on sanitary science by Mr. William Spinks, Assoc. M.Inst.C.E., Lecturer on Sanitary Engineering at the Yorkshire College, the lectures being given free to the public in connection with arrangements made by the Corporation with the County Council and the Yorkshire College. The Mayor (Ald. Smith) presided, and said the subject of the lecture, "Sewerage and Sewage Disposal," was of great interest to Ripon, seeing that the Corporation contemplated the adoption of some scheme for the disposal of the city sewage. Sanitary science was making great progress, and the Local Government Board were far more stringent now than in any previous period. Mr. Spinks, in the course of an interesting and instructive address, said the subject was one of paramount importance, seeing that the Rivers Pollution Act had

put in an appearance, not only in the district, but throughout the land. No doubt it might appear hard for the people of Ripon to have to provide works for the prevention of the pollution of the river, seeing what an enormous volume of water was daily passing down it; but they were not singular in that respect, for towns of similar geographical situation in other parts of England were being dealt with precisely in the same way. The self-purifying action of rivers had been demonstrated by scientific investigation in Germany and America, but the Local Government Board took no notice of the self-purifying action of a river. Mr. Spinks examined in detail the various systems of dealing with sewage, and said the question was one in which the knowledge of the chemist must be combined with the practical work of the engineer, as different kinds of sewage required different treatment. The Local Government Board required that an acre of land for every 2,000 of population should be set apart for even the most economical sewage works, and a threepenny rate was the average of the working expenses. Most towns had to pay a rate of a shilling or fifteenpence for no particular benefit to themselves, but for the benefit of their neighbours. A vote of thanks was given to Mr. Spinks, on the motion of the Mayor, seconded by Mr. Husband, chairman of the Sanitary Committee.

PEN AND PENCIL CLUB, EDINBURGH.

At the December meeting of the Pen and Pencil Club the committee reported that an anonymous donor had entrusted them with a sum of 100*l.*, to be expended in affixing memorial tablets to the houses in Edinburgh in which eminent literary men and artists had been born or had resided. The chief conditions attached to the gift were that the men first honoured in that way should be Scott, Burns, Adam Smith, David Hume and Raeburn, and that for the future no man should be so commemorated until he had been dead for at least twenty years. The club, on the advice of the committee, resolved unanimously and cordially to accept the gift and to thank the donor, and remitted to Dr. Scott Dalglish and Mr. John Harrison, as a sub-committee to report on the best means of carrying out the object of the trust. The report of this sub-committee was submitted to the general meeting of the club, and was unanimously approved. It may be interesting to note what has already been done in the way of indicating memorable houses

in Edinburgh. About six years ago a handsome mural monument was put up by the Corporation at the corner of Chambers Street and Guthrie Street, to mark the site of the house in which Sir Walter Scott was born. De Quincey's lodging in 42 Lothian Street is indicated by a tablet affixed to the house some years ago by Mr. J. R. Findlay. A tablet affixed to the first storey of 58 High Street, at the head of South Gray's Close, marks the birthplace of Henry Erskine, and of his brother Thomas, the Lord Chancellor. The reputed house of John Knox is a little lower down on the opposite side of the street. At the corner of St. Mary Street and Boyd's Entry, a tablet indicates the site of Boyd's Whitehorse Inn, where Johnson and Boswell lodged during their visit to Edinburgh. There is a weather-worn and scarcely decipherable board over the first-floor windows of Allan Ramsay's house in the High Street, on the north side, a few doors below North Bridge Street, and this the secretary of the club (Mr. W. W. Macfarlane) has generously offered to renew. A similar board has been affixed to the birthplace of David Roberts at Stockbridge, by Bailie Dunlop, to whom the property now belongs. The lodging of Charles Darwin, when a student at the University, is indicated by a round plaque over the doorway of No 11 Lothian Street, put up by Mr. Ralph Richardson.

BUILDER'S CLAIM.

THE case of Nightingale v. Sir C. Nicholson and others (the London, Liverpool and Globe Insurance Company) was resumed before Mr. P. E. Pilditch, sole arbitrator, at the Surveyors' Institution, on the 16th and 17th inst. The claim is one by a builder for a considerable sum for reinstating a large block of warehouses at Rotherhithe, against the insurance company who undertook the reinstatement. For the plaintiff (the builder) appeared Mr. F. R. G. Radcliffe, instructed by Messrs. Mackrell, Maton & Godlee; and for the insurance company, Mr. Dickens, Q.C., with whom was Mr. Cecil Chapman, instructed by Messrs. Lee & Pembertons. In addition to the professional gentlemen who previously gave evidence on behalf of the plaintiff, Mr. Nightingale (the plaintiff) and Mr. James Frazer gave evidence on the builder's behalf, and were under examination and cross-examination during the whole of the sitting. The further hearing of the case was adjourned until January 24 and 25 instant.

HOUSE OF JACQUES CŒUR, BOURGES.

NEW WING, NORTH INFIRMARY, CORK.

LONDON BUILDINGS BILL.

THE following suggestions to the above Bill are offered by Mr. Frederick Meeson, architect, district surveyor for East Hackney North:—

Sects. 40, 45, 64 and 185 (sub-sect. 20). These sections read together, as they must be, present difficulties. Two buildings may have for a small area a wall in common, that being undoubtedly a party wall, whilst the walls extended in the same plane as that party wall are actually external walls, but are to be deemed party walls, for any distance laterally and in height to 10 feet above the roof of the lower building. Then either an opening could not be made in these external walls—which lawyers would probably regard as absurd—or an opening could be made immediately above the roof of the lower building, which it is apparently the aim of sect. 45 to prevent.

Sect. 47. This section has the defect of allowing a horizontal chise 14 inches wide and 4½ inches deep for nearly the whole length of a party wall 13 inches thick.

Sect. 50, sub-sect. 4. It might be better to substitute a definite height for the closing words of this sub-section.

Sect. 55, sub-sect. 1 (b). The height of 8 feet 6 inches appears excessive, and is a great increase from 7 feet, which is required by the present law.

Sect. 58. This section needs modification to meet cases in which the building and passage, though in one occupation, or without occupation at the time of their construction, are afterwards let separately. Ties should be specified to the arches.

Sect. 60. The projection of 3 feet might be increased a little.

Sect. 68. Seems to require a statement that an enclosed railway arch shall be deemed to be a building.

Sect. 127. It might be better to describe the notice mentioned in sub-section (b) as "building notice."

In any case in which a building notice shall have been given, the district surveyor would not have his present power of requiring work to be laid open, should a wrongful act or omission be suspected but not be known.

It also appears that, as hitherto, a notice of irregularity cannot be served after the completion of the works, but it is most desirable that the district surveyor should have power to serve a notice of irregularity within one month after completion, or after discovery, of an irregular building or work, and it may be that a magistrate would hesitate to inflict a penalty under sec. 179, in any case in which another mode of proceeding would seem to be prescribed by the Act.

Sect. 131. The desirability of remunerating district surveyors by salary instead of fees is recognised in this Bill as in the present Act, but the step should have been taken, for who can doubt the impropriety of their receiving their daily bread at the hands of those whose work they have to overlook, and how can they without some loss of dignity do the business of a tax-gatherer? This question should be looked at only from the point of view of what is best for the public service.

Sect. 169. Under this section the district surveyor could only make one survey of a completed irregular building.

Sect. 180, sub-sect. 18. One small detached greenhouse to each dwelling might be exempted.

THE SHOOTER'S HILL HOSPITAL.

At the meeting of the Board of Guardians of the City of London Union on Tuesday, the *City Press* says that Mr. Lile asked if it was correct that the Asylums Board was about to build at Shooter's Hill a hospital costing 220,000*l.*, for 500 patients, which meant 450*l.* per bed? Mr. Lobb also asked whether this enormous expenditure arose mainly from the conditions imposed by the Local Government Board with regard to space? Mr. Lindsey said that owing to illness he was unable to attend the last meeting of the Asylums Board, but he believed the statement of Mr. Lile was perfectly correct. He had been present on the previous day at a meeting of the General Purposes Committee of the Asylums Board, when the committee considered the matter which had been referred back to them. He thought that as a result the expenditure would be reduced to 193,000*l.*, a reduction of about 27,000*l.* With regard to Mr. Lobb's question, there was no doubt that the Board had been considerably restricted by the Local Government Board. The Local Government Board did interfere, and when it did give its consent, after some tardiness and considerable delay which had resulted in great suffering and inconvenience to the poor, it insisted upon many

restrictions. These referred, for instance, to the number of cubic feet to each patient, the wards being a certain distance from the roadway, and in this case from the Herbert Hospital, and no doubt these restrictions interfered very much with the economy that might be exercised. He thought this 193,000*l.* might be further reduced, as he had pointed out to the General Purposes Committee, by another 5,500*l.* This was the cost of the installation of electric lighting. He utterly failed to see—he was only one by himself on the committee—how electric lighting could benefit fever patients, seeing that there must necessarily be an installation of gas as well. It might save trouble to the attendants, perhaps, but that was all. He was afraid that if the electric light was granted in this case all the other hospitals would ask for it, and the consequent expense would be very great. Mr. Willmott said he had gone very carefully through the plans for the new building with the architect, and he might say that not a sixpence was to be spent in ornamentation. A plainer, more Quakerish looking building could not be conceived. The architect had shown him that it was impossible with the necessary efficiency to avoid the expense, which was not extravagant when it was considered that the building would be for over 500 patients. There was every desire to keep expenses down. The work would be put up to contract in such a way that a fair portion should go among the medium-sized builders. It was the large contractors who made the big profits. The thing was in very good hands, and when the work was done the ratepayers would be satisfied. Mr. Loxley asked whether it was a fact that 300 nurses would be appointed? Mr. Lindsey replied that the number had been reduced by one-half, namely, to 150.

THE Corporation of Bolton is engaged in an important series of public improvements, including alterations to the Market Hall (by the conversion of the exterior into shops), involving a cost of 8,000*l.*; the establishment of a new scavenging depot at Back o' th' Bank, for which 30,000*l.* has been borrowed; and the laying down of an electric installation, which, when complete, will have cost about 40,000*l.*; and the redecoration of the Town Hall, at an expenditure of some hundreds of pounds. The postal authorities are also engaged in extensive structural improvements at the central post-office, at a cost of 3,000*l.*

NORWICH MAIN DRAINAGE.

A VERY important contract has just been placed in the hands of Mr. F. H. Brook, of 171 Queen Victoria Street.

The Corporation of the City of Norwich have been for some time anxious to replace the existing old and unsuitable sewers by an entirely new system of main drainage, which will be in accordance with the latest and most scientific views of the day and which will also provide for the future requirements of the city. For this purpose there will be required about 52,000 feet, or say ten miles, run of stoneware pipes, bends and junctions, ranging in size from 6 inches to 21 inches diameter, and which Mr. Brook has been selected to supply. As the Norwich Corporation intend that their new system of drainage shall be a perfect one, it was indispensable that all the pipes and materials chosen should be of the most enduring quality and the most perfect construction. By entrusting so important an undertaking to Mr. F. H. Brook the Corporation are only expressing the confidence which is generally felt in his capacity and the excellence of his ceramic productions.

THE INSTITUTION OF ELECTRICAL ENGINEERS.

At the ordinary general meeting of the Institution of Electrical Engineers, on the 12th inst., Mr. Alexander Siemens, the president for this year, delivered his inaugural address. After reviewing the history of the legislation during recent years in connection with electrical development, he said that during the past twenty-two years their profession had changed its character and become much more intimately connected with the everyday life of the general public. The result of the legislation had been to create a number of difficulties in the establishment of distributing systems in the United Kingdom, but the financial success which had invariably attended the municipal electrical enterprises had relieved the rates at the expense of the wealthier classes in a perfectly legitimate manner, and the more electricity became one of the common necessities of life the better it was that its supply should be in the hands of the community, and not in those of monopolists. The principal hindrance to the development of electrical engineering must be looked for in the exaggerated expectations that were raised, either by ignorance or by design, when the

general public first seriously thought of regarding electricity as a commodity for everyday use. In its first stage the development of the electrical industry was closely connected with telegraphy; the second step might be said to have been taken when electric lighting was introduced; and now it seemed that transmission of power was to be the problem which electrical engineers had to grapple with in the near future. The success of electric tram-lines had undoubtedly contributed to direct general attention to the transmission of power by electricity, but great care would have to be exercised so as not to start in a direction that could lead to no practical results. Many schemes had been started to introduce electricity as the motive power on the main lines of railway, and to accelerate at the same time the speed of the trains, even up to 200 miles an hour. It would be rash to say that such a speed would not be attained some day, but in his opinion none of these schemes could be carried out on a commercial basis with the means at present at disposal. The conclusion of the address was devoted to the improvement which had within recent years taken place in the education of electrical engineering students, and emphasis was laid upon the importance of workshop experience.

SANITARY APPLIANCES.

AN illustrated supplementary catalogue for 1894, dealing particularly with improved specialties in water-closets, has just been issued by Mr. George Jennings, of Lambeth. One of the principal features in the catalogue is Jennings's improved "closet of the century," with syphonic discharge, a combination water-closet, urinal and slop-sink. This appliance is intended to combine the simplicity of the ordinary "flush-down" cottage basin and trap with the advantages of a valve closet, having a full basin of water 6 inches in depth, a seal of 3 inches, a surface area of 12 by 10 inches, and being entirely free from mechanism of any kind. It may be had in white or decorated earthenware, strong fireclay or enamelled iron, at prices to suit any class or style of building, high-class buildings included. The basin is secured against the possibility of being syphoned by discharge of slops, while the complete removal of contents after use is insured. It has a special form of patented outlet joint, securing an air-tight connection to the lead trap below or above floor level. There is a special flush and an after-flush. The cistern, of simple construction, is quick-

filling and noiseless. The service pipe from the cistern has two connections to the closet, one leading into the basin in the usual manner, and the other to the syphon pipe. The flush is by this means divided into two streams. The one flushes the basin, the other stream expels the air through a puff-pipe, starts the syphonic action, and empties the basin, which is refilled with clean water by a simple after-flush arrangement in the cistern. The working of the closet may be readily seen on examination of the illustrations given in the catalogue. The drawings are in section to a scale of one-eighth full size, much enhancing their usefulness. Five full-sized plates also show the "closet of the century" as adapted for different positions, various circumstances, requirements, buildings where strength is an important desideratum, &c. In price it ranges from about 5/-. By going to a little extra expense any amount of enrichment may be obtained. Jennings's "deep seal" wash-down closet is specially adapted for buildings where strength is required. It is a combination water-closet, urinal and slop-sink. The basin and trap are of one piece of glazed fire-clay, or it can be supplied in white or decorated Queen's ware of best quality. The water-surface area is 7 inches long and 5 inches wide, with a depth of 5½ inches. There is a seal of 2½ inches, yet the flush is so directed and concentrated that the contents of the basin are effectually driven through the trap into the drain and the interior of the closet thoroughly cleansed. These closets come still cheaper than the "century closet." Jennings's "1891" patent pedestal valve-closet and trap is illustrated as fitted up fully with water-waste preventer cistern. If desired, Jennings's anti-percussive regulating supply-valve may be substituted for the cistern. Jennings's "improved era" is a valve water-closet of the Bramah type with anti-percussive regulating service valve, flushing rim basin, large weir overflow, union for vent-pipe at highest point, and the iron-work is galvanised.

PROTECTION FROM FIRE.

THE British Metal Expansion Company, Limited, of 2 Lambeth Hill, E.C., have arranged in their show-rooms a series of models with a view to the practical display of the merits of their expanded metal lathing in connection with fireproof construction. This system of fireproofing is protective to speak accurately. Constructive fireproof work depending on walls, partitions, floors, staircases, &c. is formed of fire-resisting

SPRINKLER, Closed.

THE GRINNELL AUTOMATIC SPRINKLER And the Great Fire in Old Bailey.

LETTER FROM "THE TIMES."

"CASSELL & COMPANY (Limited) write to us, under date November 16, as follows:—'Will you kindly allow us to state that the fire which took place in Fleet Lane last night, and by which a portion of our premises was damaged, will not in any way interfere with the punctual issue of our magazines, periodicals and books? All our monthly magazines for December will be issued at the usual date, and our weekly periodicals, *Cassell's Saturday Journal*, *Chums*, and *Cottage Gardening*, at the ordinary time next week. This week's issue of *Work* and of the *Speaker* may be an hour or two late; but full editions have been prepared, and will be obtainable in the ordinary course. We should like to add, for the information of your readers in general, and of those interested in insurance matters in particular, that the system known as GRINNELL'S AUTOMATIC SPRINKLERS, which we adopted some years ago as a protection against fire, acted admirably on this the first occasion on which it has been practically tested, and undoubtedly did much to save our buildings from serious damage by fire.'

materials, such as stone, brick, concrete and ironwork, whereas this system is designed as a fireproof protection for combustible materials, and is called the "Expanded Metal" lathing, the above-named company being the sole proprietors and manufacturers in the United Kingdom. One great aim has been the employment of the best material to secure the best quality of metal lathing. Mr. T. Lewis Banks, F.R.I.B.A., has issued a pamphlet descriptive of the system, in which he explains that "expanded metal lathing was discovered, rather than invented, by Mr. Golding, of Chicago. His first thought was to produce a cheap and strong open fencing by expanding incisions in thin steel, and not until he had done so did he see what an admirable substitute it would be for the ordinary wood lath, if the meshes were made smaller."

The models on view show floors, walls, partitions, ceilings, &c., both in course of construction and finished, and supply an easily understood object lesson of the value of the material for such and similar uses.

Expanded metal lathing being made from sheets of fine steel combines at once the maximum of lightness and of strength; it is obviously non-inflammable, and the interstices, being at an angle of 45 degs. with the sheet, form an admirable key for the plaster or cement applied thereto.

The model of an "open" fireproof floor, for which Mr. Banks has secured provisional protection, aptly illustrates these qualities. It is constructed of light girders, on the flanges of which rest light iron or steel centres, and on these the expanded metal for the support of concrete is laid. The centres carry the weight of the concrete until it has set, when they are only required to support the ceiling.

The tie-bars of the centres are kept horizontal by means of metal strips, which can be moved towards the centre should the weight of the concrete in course of drying cause a slight deflection. The expanded metal for the ceiling is suspended to the tie-bars by patent hooks and rods, so that no wiring is required. It can be seen that there is a space between the ceiling and the concrete floor above, which can be utilised for purposes of ventilation or for gas and water pipes, bell wires, &c. In the model of a "solid" floor, also provisionally protected, the expanded metal lathing is suspended below the iron girders by specially-designed clips and rods. On the upper side of the lathing is placed a layer of hair plaster, which is allowed to dry and harden before the space between the girders is filled in with concrete. By this method the plaster, having served its purpose as a bed for the concrete, forms a perfect

key for the ceiling beneath. A model of a solid plaster partition, 2 inches thick, shows what may be done where economy of space is a desideratum, and has the merit of being extremely light and at the same time perfectly rigid. As a protection of wood from fire, the lathing can be fixed at any desired distance from it, and as in other instances the method of fixing is very simple and no wiring is needed. Metal loops, or elongated eyes, are screwed into the joists of the ceiling or driven into the studs of the partitions, rods are threaded through the eyes on each side of the metal lathing, thus fixing it in position, and the same principle can be applied to casing wood beams and posts. The new and revised price list of the company shows a reduction in prices.

MUNICIPAL GAS SUPPLY.

OUT of the 302 municipal corporations in England and Wales only 75 have undertaken to supply gas in their boroughs. From the Board of Trade returns which have been issued this year, showing the operations of local authorities' gas undertakings up to March 25, 1893, it appears that in the United Kingdom there are 185 local authorities having their own gas-works, being an increase of three since last year. These 185 undertakings are made up as follows:—75 belonging to English and Welsh municipalities, 70 carried on by English and Welsh Local Boards or Improvement Commissioners in non-incorporated districts, 34 in Scottish burghs, and 6 in Irish towns. These 185 undertakings have borrowed 22,734,556*l.*, of which 4,767,254*l.* has been repaid, leaving their present indebtedness 17,967,302*l.*, upon which there was paid during the last year in the way of interest and instalments 994,517*l.* The net profits of the aggregate undertakings amounted to 305,040*l.*, the greater part of which was used in relief of rates, and part as rebate to the gas consumers. In the case of Leeds, the gas was supplied at 2*s.* 2*d.* per thousand feet, less discount 2½ to 5 per cent., the illuminating power being 17 candles. The total receipts in respect of the gas undertaking for the year was 305,963*l.* The expenditure on account of the works was 250,128*l.*, and the payments on capital account were—interest on loan, 42,576*l.*; to sinking fund, 10,118*l.*; total on account of capital, 52,694*l.* Profit, 3,141*l.*; tons of coal used, 251,500; cubic feet of gas made, 2,503,544,500; miles length of gas mains, 710; number of consumers, 76,200; number of public lamps, 9,471.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

STORAGE OF RAIN-WATER.

THE year 1893 will long be remembered for the severity of its drought. The importance of storing and preserving rain-water came home that year to many householders as a matter of urgent necessity.

Fig. 1.—Section of Vertical Separator.
Impure Water Passing to Waste.

Rain-water Separator. Mr C. G. Roberts, of Haslemere, Surrey, has worked at this invention for many years. In 1886, and again two years later, we described and illustrated the improve-

Fig. 2.—Section of Vertical Separator.
Pure Water Passing to Storage.

Now that rain-water can be stored in a pure state it is much more generally useful than it was before the introduction of the

ments that had then been introduced in the design of this ingenious automatic apparatus. No illustration has been given

in our pages since 1888, and as many are interested in the subject of storing pure rain-water, we now show in figs. 1 and 2 sections of the Vertical Separator, which is used where a single stack-pipe carries the water from the roof, and in fig. 3 the exterior of the horizontal form, for attachment to an underground pipe that serves to collect and convey into the tank rain-water from any number of stack pipes that may be attached to one or several independent buildings.

Fig. 1 shows the vertical separator in the position that it retains when running foul water into the waste pipe during the first part of a shower, while the roof is yet dirty. Fig. 2 represents it when it has canted and has begun to run pure water into the storage tank after the roof has become clean. The change of position is effected by the gradual accumulation of a small portion of the water in the chamber J of the canter; when the water reaches a certain height it makes the left side heavier than the right, and the canter turns a little on the pivot M that supports it, so that the water is delivered 2 inches further to the right than it was before; and, whereas it at first ran through N into the waste-pipe, it now runs through O into the storage-tank.

In figs. 2 and 3, AA are strainers removable for washing. B is a removable slide with two small holes to regulate the flow of sufficient water to work the canter. C is a sluice to be adjusted to the area of the roof. D is the outlet for surplus water. In moderately heavy rain the main volume of the water flows through this spout D into the delivery-pipe E, running round the right hand of the canter; a small proportion only passes through the strainer and out of the small holes B into the funnel F, that terminates in the small hole G.

In a very slight rain the whole of the water passes through the strainers and the hole at B into F, and when it is not enough to effectually wash the roof it all escapes through G without making the canter move. When there is more rain than can pass through the hole G, it rises in F and L, and a small quantity runs over the side of the funnel, slowly filling the chamber J. When J is filled to a certain height, it overbalances the canter and makes the water run to a storage through O, as shown in fig. 2. This change in position causes the water from B to run into T, and cease to run into F. As the water sinks in F it also sinks in L, causing the siphon K to act and empty the chamber J. Meanwhile the little chamber w is partially filled by water running through T, V, W, and Z, and its weight prevents the separator from recanting until the water ceases to run from the roof.

As soon as W is empty, the canter rights itself, ready for the next rainfall, the right-hand side of the canter being heavier than the left when it is empty. By means of the joint action of the sluice C and the holes at B and G, the flow of water in the working part of the separator is so regulated that the chamber J is filled to the canting point as soon as a certain quantity of rain (a gallon, more or less, on each 100 square feet of roof) has fallen, either quickly or slowly.

Three slides, marked 1, 1½, and 2, are sent with each separator. The one marked 1, intended for use in the country, allows about one gallon; and the one marked 2, for city use, allows about two gallons for washing each 100 square feet of roof.

The horizontal separator (fig. 3) is, like the vertical, self-acting, needing no attention except an occasional washing at long intervals. For large buildings or groups of buildings it is far preferable to the vertical form, for instead of needing a

Fig. 3.—Horizontal Separator in Normal Position.

separate machine for each stack pipe a single one will serve for all the water that flows into the tank or reservoir. The cost, 3½ and upwards, is small compared to that of building the tank, which by this addition becomes a reservoir of pure soft water, instead of receiving, as it usually does, all the soot, bird droppings and other impurities from the roof.

At the meeting of the Edinburgh Water Trust, Mr. Coyne, engineer, in his monthly report stated that the number of pipes laid during December was 377, of which 316 were in extension of the system. The number of apparatus examined for the checking of waste of water was 28,803, of which 1,515 were faulty or in a state of disrepair. There were upwards of 300 burst pipes in the city owing to the recent severe frost, and that the officials of the Trust have during the last two days issued 800 notices with regard to burst pipes or defective apparatus.

PURIFICATION OF RIVERS.

A PAPER on "The Evolution of Opinion on the Self-purification of Rivers" was read by Mr. William Naylor, F.C.S., M.I.C.E., chief inspector of the River Ribble Joint Committee, before the members of the Association of Medical Officers, at their last monthly meeting. In the course of his paper Mr. Naylor gave an account of this evolution of opinion, dating from the proceedings of the Rivers Pollution Commissioners during the years 1868 to 1872. The Commissioners' report said:—"We are led to the inevitable conclusion that the oxidation of the organic matter in sewage proceeds with extreme slowness, even when the sewage is mixed with a large volume of unpolluted water, and that it is impossible to say how far such water must flow before the sewage-matter becomes thoroughly oxidised. It will be safe to infer, however, from the above results, that there is no river in the United Kingdom long enough to effect the destruction of sewage by oxidation." Reference was made to the subsidence of a large proportion of the grosser mechanically suspended particles which undoubtedly does take place in the quiet reaches of the Mersey and Irwell. To this partial subsidence and consequent clarification may undoubtedly be attributed the very general but erroneous belief in the rapid self-purifying power of running water. "It must be remembered, however, that the mud so thrown down is only deposited, not removed or rendered innocuous." Mr. Naylor mentioned the opinions of Dr. Tidy and Dr. E. Frankland. The latter said that "if peaty matter dissolved in river water is spontaneously oxidised at all, the process takes place with extreme slowness and cannot be accomplished to any considerable extent in the flow of a river, for our results show that peaty matter is even less oxidisable than animal matter under the same conditions." In conclusion, Mr. Naylor, after quoting other opinions, gave in effect the following:—1. Rivers deposit sediment on the banks and bed, and are thereby purified. 2. That the soluble matter in rivers is affected according to the chemical composition of the beds and banks. 3. That very little oxidation of organic matter takes place due to the direct effect of atmospheric oxygen. 4. That very considerable and appreciable alterations in the amount of organic matter are brought about by organisms in the river waters. 5. But that the length of time which must elapse before a river can become sufficiently purified from sewage is greater than afforded by the course of English rivers.

NEW BOARD SCHOOLS, READING.

NEW Board schools recently erected for the Reading Board, and to be known as "Battle" Schools, have just been opened. They have classroom accommodation for 1,136 children, with a cookery centre and caretaker's residence. The buildings are all of one storey, in three separate detached blocks. The main block is the mixed school for 768 boys and girls. The second block is for 364 infants, and the remaining block consists of the cookery school and caretaker's house combined. The arrangements of plan are on the classroom system, with central halls, the mixed school having thirteen classrooms and the infants' school six.

There is ample cloak-room and lavatory accommodation, a head-master's room and separate private rooms for the staff of teachers. The buildings are faced externally with Higgs & Sons' hand-made red bricks, with strings and other features carried out in special moulded brick, and the shaped and moulded gables form a pleasing skyline and give a distinctive architectural treatment to the external appearance of the buildings. A marked feature in the centre of the group is a lofty campanile, which serves as a ventilating shaft communicating with underground passages and culverts, through which the vitiated air is drawn from the several rooms and halls by means of a propeller worked by a gas-engine, and a constant circulation of fresh air is thus secured. The heating is by means of hot-water ventilating radiators and coils. All the windows are fitted with Leggott's gear for summer ventilation; the floors are of pitch-pine blocks, laid by the Wood-block Flooring Company; the whole of the playgrounds are paved with "Granitic" paving throughout, and the premises generally are fitted in a most complete manner, and may claim to be regarded as a pattern of a well-ordered school.

The builders are Messrs. Higgs & Sons, of Reading; Mr. R. Pratt was clerk of works, and the architect is Mr. S. Slingsby Stallwood, F.S.A., of Reading.

DRAINS IN DUBLIN.

In a letter to the *Irish Times*, Mr. Kaye Parry writes:—

I think I may fairly claim to know as much as most men about the condition of house drainage in the city of Dublin, but hitherto I have refrained from taking part in the controversy regarding the health of Dublin, as I do not think there is anything to be gained by attempting to answer all the ill-considered

and irresponsible statements which are made from time to time by amateur sanitarians.

In justice to a large number of my clients I must, however, protest against one of the proposals of the Chairman of the Public Health Committee. It is suggested that all the cross-drains under the footpaths and roadways from the houses to the sewers should be made perfect, and that this should be done at the expense of the owners or occupiers.

I am fully alive to the necessity of making these branches perfect, but I think I can show that it would be a grave injustice to saddle the house-owners of Dublin with the expense.

For very many years all these branch-drains have been laid by the Corporation workmen, and no private engineer has been allowed to interfere with the method of construction or to apply any test. I have never seen any of these branch-drains subjected to any test whatever. I introduced the water test into Dublin in the year 1883, and ever since then I have made it a rule to test every house-drain in this way in cases in which I have been professionally engaged. I know therefore what this test means, and I give it as my deliberate opinion that not a single cross-drain between the front areas of the houses and the main sewers would stand this water test. If these branches are not watertight they are not perfect, and if they are not perfect they should be reconstructed. The question then remains at whose expense this should be done. Although all these connections have been made by the Corporation workmen, the house-owners have paid for the work. A sum of money sufficient to cover the expense has to be deposited in each case at the City Hall by the owner or occupier before the work is commenced.

During the last ten years, while the water test has been known and generally adopted in Dublin, the Corporation have continued to lay these branch-drains at the expense of the house owners or occupiers without testing them. If all this work has to be done again it will surely be a very great hardship to make the owners pay a second time.

I find there are 25,764 inhabited houses in Dublin. The average cost of reconstructing the cross-drains from these houses to the sewers would certainly not be less than 7½. each, and this would involve a total expenditure of 180,348½.

In my own practice within the city boundary since 1883, I have superintended the reconstruction of the drainage of some 250 houses, and in almost every one of these instances a new connection has been made with the street sewer at the expense of my clients.

As these figures, of course, only represent a small proportion of the total number of street connections laid, it is evident that the outlay necessary to remedy the defective work of even the last ten years will be very large.

RATING OF LAND VALUES.

THE following resolution was adopted at the meeting of the London County Council on Tuesday :—

"That as it is imperatively urgent that a measure should be passed next session for the taxation of ground or site values, and as this cannot be done unless the Bill be brought in as a Government measure, the Council is of opinion that all lands situate in municipal areas and whether partially or entirely covered with buildings or existing as vacant land should be made directly liable to local and other taxation, and for that purpose should be entered in a separate column in the valuation lists; and that no contract should be allowed to affect any charge falling or imposed on the land value as stated in the land value column. That, with a view to the framing and introduction of such a measure, a copy of this resolution be forwarded to the Government together with the following documents :—(a) Report of the Local Government and Taxation Committee, November 29, 1893; (b) Land Values (Taxation by Local Authorities) Bill, introduced into Parliament February 1, 1893; (c) memorandum by the vice-chairman of the Council on the subject of that Bill; (d) reports by the valuer of the Council upon the above report and Bill and the various documents therein referred to; and that the chairman and vice-chairman of the Council, the chairman and vice-chairman of the Local Government Committee, Mr. Stuart and Mr. Mc'Kinnon Wood be appointed a committee to communicate with the Government on the subject and report further to the Council."

The proposals of the Local Government and Taxation Committee of the Council are as follows :—

1. That it is necessary without further delay to provide for a taxation of site values to extend to and be leviable upon all interests which share in the site value, and that for that purpose it is desirable to provide in the valuation lists a column for site values, including vacant land, in addition to the columns already provided for.

2. That the term "site value" be defined as follows :—
"The annual rent which at the time of valuation might reasonably be obtained for the land comprised in any hereditament

WORKS, ROTHERHAM. Estab. 1854.

as a cleared site if let for building by an owner in fee; or, if the land be not built on or let for building, a proportion equal to 4 per cent. of the price which at the time of valuation might reasonably be obtained for the land by such owner."

3. That in cases where the occupation of land for profit has been rendered possible by drainage, embankment, or other works of an analogous nature, the Council shall be empowered to provide for an allowance to be made to the owner of the site value so described, in respect of any expenditure on such works within twenty years before the valuation, provided always that any allowance contemplated under the above resolution shall be so expressed as to be independent of past or present municipal expenditure.

4. That, without prejudice to such other uses of the site value column as Parliament may determine, a new and specific rate should be imposed upon the site value, and that the site value rate ought to be started as a specific tax of so many pence in the pound.

5. That the tax should commence at a rate (to be named in the Bill) of 1s. in the pound upon the assessments appearing in the site value column.

6. That the Council should be empowered to alter the tax from time to time by an amount not exceeding 2d. in any one year, so that the rate shall not exceed 2s. in the whole.

7. That the new rate should be collected by the local authorities for the Council, and that a proper allowance for cost of collection should be made.

8. That, for purposes of recovering arrears, the Council should be empowered at its option to make and register an order charging arrears on the site.

9. That the rules of deduction above stated be approved.

10. That the method of collection and draft forms proposed by the sub-committee and approved, by us be adopted as the basis of a scheme to be embodied in a draft Land Values Rating Bill.

11. That in any such draft Bill a clause should be included as to existing or future contracts corresponding with Clause 13 of Mr. Dalziel's Land Values Bill.

12. That in any case where the whole of the site value as defined in Resolution 2 cannot be obtained, used, or enjoyed by the persons to be charged, then the assessing authority should be entitled to take all the circumstances into consideration, both in assessing the total amount to be inserted in the site value column, and in the apportionment of the rate among the various interests.

13. That all persons alleging that the rules of deduction do not apply to their case, either because of the last resolution or otherwise, should have power of appeal to the assessment authority in the first instance against the apportionment.

14. That any person alleging that the rules of deduction do not provide for his case should have a summary right of appeal to the new Valuation Court proposed to be created, or to any corresponding tribunal.

15. That the proposed Land Values Rating Bill should be applicable to all municipal areas in England.

16. That these resolutions, together with this report and the further papers circulated to the Council, be referred to the Parliamentary Committee, with instructions to prepare a draft Bill on the lines indicated.

THE INSTITUTION OF CIVIL ENGINEERS.

At the last ordinary meeting held, Mr. Giles, president, in the chair, the subject of the "Concentration and Sizing of Crushed Minerals" was dealt with in a paper by Mr. Robert E. Commans, Assoc. M. Inst. C.E.

The author first referred to the object of concentration, which was to remove impurities with which minerals were associated and to render them marketable. He then enumerated the several stages of handpicking, crushing and dressing, through which the minerals had to pass. The first two operations were briefly dealt with. Handpicking underground was carried out in order to avoid raising more waste rock than was absolutely necessary, and to pick out the very rich lumps to prevent them from being knocked about and broken. Owing to lack of light and the limited time at the men's disposal, this form of separation was naturally of a rough character and was usually followed by more careful handpicking on the surface. Where large quantities of coal had to be examined horizontal endless belts were generally employed. These were composed of steel plates or wire netting, and had a width of 4 feet to 4 feet 6 inches. When travelling at a rate of 40 to 50 feet per minute they had a capacity of 30 to 40 tons per hour. Revolving picking-tables were mostly used for ore, the pickers sitting round the periphery. To keep down the dust from the ore which had been previously crushed to about $1\frac{1}{4}$ inches size, it was washed with a spray of water. These picking-

COMYN CHING & CO.

LONDON, W.C.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in $4\frac{1}{2}$ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

THE "ECLIPSE" PAINT REMOVER & CLEANSER.

The Best, Cheapest, and Most Effective in the World.

1a CRESCENT, MINORIES, LONDON, E.C.

tables had an outer diameter of 10 feet and a width of 20 inches, and revolved at a rate of from 30 to 40 feet per minute.

The machines, stone-breakers, rolls and stamps used for ore-crushing were fully described in a paper by Mr. A. H. Curtis, read before the Institution in 1892.

For reducing lump-coal prior to mechanical separation, fluted or toothed rolls were commonly employed. When crushing ore or coal the greatest care had to be taken to avoid all unnecessary pulverisation and, as far as practicable, the ore or coal ought never to be reduced beyond the point at which the pieces of mineral were freed from their rocky matrix. The first operation, after crushing, was the careful sizing of the material. This was usually performed by means of screens. The limit to which crushing and sizing should be carried must be determined in each special case. For sizing lump-coal it was the practice to employ some form of bar-screen. One of the most improved mechanical screens, known as the "Coxe" screen, and used for screening anthracite at the Cross Creek Collieries, Pennsylvania, was fully described. This screen resembled somewhat the well-known "Briart" screen, but differed therefrom in that the outer end of the bars only moved up and down half the stroke of the eccentrics, and thus lessened the tossing action and the tendency to break the lumps. Another ingenious screen, also invented by Mr. Coxe, for sizing small lumps of coal and shale before washing, working on the gyrating principle, was mentioned. This screen consisted of a strong iron box or casing, fitted with punched plate screens, the screen-box itself being carried on four double-chilled cones of special design. The motion of gyration was imparted to the screen-box by means of a vertical central crank. This motion could best be illustrated by imagining the movement of a plate resting on spheres of equal diameters, moved by hand in a circular direction, when it would be evident that every point of the plate or screen described a circle of equal diameter, but with different centres. These screens could be used for wet or dry material, and the friction being entirely a rolling one, small power was required to drive them. Cylindrical screens were mostly used for sizing coal, and nearly exclusively for ore, as this was invariably fed into the screens in a moist condition and washed during the operation of screening by a spray of water. These screens took little power to drive, ran smoothly, without shock or vibration, were simple in construction, and capable of easy examination and repair. The author indicated the sizes into which it was usual to classify coal and ore, adding that

the tendency in this country had been rather to neglect sizing altogether, and on the Continent to go to the other extreme by adopting almost unnecessary refinements. A brief consideration of the principles underlying the sorting or separation by gravity of particles in water was next given. Jigging-machines, on account of their great simplicity and large capacity, were more used than any other form of apparatus for sorting, not only the comparatively coarse crushed material, but also the fine. The various forms of hutches, sieves and pistons were discussed, and several methods for removing the concentrates and driving the pistons were described. In order to separate particles of different specific gravities below from 2 to 1 millimetre in diameter, which did not permit of being satisfactorily sized by means of screens, and to render them suitable for after-treatment, they required to undergo a preliminary sorting or hydraulic classification. This was commonly carried out in so-called pointed boxes of various forms. Two interesting designs of this class of apparatus were referred to. The one known as the "Calumet," which was largely used in the Lake Superior district for sorting the finely crushed native copper ore; the other the "Siphon" separator, used so successfully at the dressing-works of Mechnich for separating nodules of galena from a matrix of white friable sandstone. When jigging sand or meal-products which had been sorted through pointed boxes, a layer or bedding of rich mineral, or of some material of a specific gravity greater than that of the barren rock, was commonly employed. This bedding, resting on the sieves, acted as a kind of filtering medium and prevented particles of less density passing through into the hutch below. With coal a bedding of felspar was usually adopted. Two forms of fine jigs, known respectively as the "Bilharz" and "Schrantz" machines, were described, the chief feature of novelty being that the sieves themselves were plunged as by the old-fashioned hand-jigs, no pistons being employed. The Bilharz fine jigs were arranged in series, a different product being separated on each machine; whereas with the Schrantz machine, one long sieve was used divided into several fields, the depth of bedding in each division decreasing slightly towards the discharge end. By means of the circular Bilharz jig, which was somewhat similar in principle to the one above mentioned in that the sieves were plunged, a still further development of the principle of jigging had been attained, and the very finest pulp concentrated. There was, however, a point where this method of separation ceased to be advantageous, as when the particles were very fine they

changed together, and required to be largely diluted with clean water to free the separate grains. Various forms of buddles, or tables, had therefore to be employed. A bump table, known as the "Gilpin County" concentrator, was described, by which, instead of the rich headings or concentrates being packed on the head of the table by the bumps imparted to it, requiring afterwards to be removed by hand, they were delivered automatically as soon as the separation took place. Under the head of "Shaking-Tables," the Frue Vanner was specially referred to. With this machine, instead of a table, an endless rubber belt was employed. The slime to be treated was delivered near the upper end; a slow upward travel was given to the slightly-sloping belt, and at the same time a gentle side shake was imparted to it to keep the slimes in agitation. This promoted the settling of the rich mineral on to the surface of the belt, to which it clung with greater tenacity than the barren rock, and was accordingly carried on the belt past a spray of water, and separated from the tailings, which were washed off the lower end of the belt. This form of concentrator had been more especially adopted for the concentration of sulphurets containing gold, which could not be caught by amalgamation. A specially interesting feature about this class of machine was that it allowed of the separation of particles differing very considerably in size. The "Linkenbach" buddle was a modification of the revolving convex buddle, but differed from this in that the bed or table was a fixture and the slime and clear-water distributors revolved. The object of having the table or washing-surface fixed was that it was found that when, from the nature of the slimes, a perfect separation of these could not well be effected on a table 18 feet in diameter, it would not be desirable to increase further the diameter of the table, as it would become unwieldy and liable to run unsteadily. Where a fixed table was employed the diameter was of comparatively small importance, and such buddles had been built with diameters of over 20 feet, giving the most satisfactory results. None of the slime-washers effected as perfect a separation as could be desired, and there was still room for considerable improvement in that direction.

The experiments carried out by Professors Hoppe and Munro would seem to prove that sizing prior to jigging was rather a disadvantage than otherwise, and suggested that before throwing over the old theories of close sizing, it was desirable that further tests should be made, in which the jig action was more closely reproduced.

In conclusion, separation by pneumatic, centrifugal and magnetic agency was referred to. The two former methods, however, did not seem to have been largely used for treating minerals. On the other hand, the magnetic separation of iron-ore from earthy matter would appear of late years to have received much attention in America, where large deposits of magnetite were being concentrated, enabling low grade ores of 40 to 45 per cent., which would not stand the cost of transport, to be concentrated up to 70 to 75 per cent., with but small loss in tailings.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

8. John Robert Blanford, for "An improved chimney-pot."
61. George Arthur Jones, for "An expansion joint for pipes."
134. Henry Harris Lake, for "Improvements in pulleys."
161. Henry Ames, for "Improvements in fireplaces for domestic and other purposes."
204. Fred. Dale Gaywood, for "Adjustable divider for rules, blades of square or measuring instruments."
238. Alfred Seymour Jones, for "Improvements in chimney-pots or cowls for chimney-pots, or cowls for chimney and ventilating shafts."
254. Robert Adams, for "Improvements in means and appliances for opening, closing, regulating and fastening at any desired angle swing windows, ventilators, fanlights, flaps and analogous articles."
270. Alonzo Read, for "An improved means for fastening and unfastening window-beads."
286. Lawrence Clarke Tipper, for "Improved draw-plate, smoky chimney doctor and fire-preventer."
344. Johan Olof Lundberg, for "Improvements in valves."

COMPETITIONS OPEN.

EAST GRINSTEAD.—Jan. 31.—Designs are invited for an Isolation Hospital. Premium £5 5s. Mr. W. Alsten Head, Clerk to the Union Sanitary Authority.

KIRKCALDY.—March 17.—Plans, &c., are invited for proposed Beveridge Public Hall, Free Library and Adam Smith Memorial Hall, &c. Mr. W. Roy Spears, Town Clerk.

MACHYNLLETH.—Feb. 28.—For Scheme of Water Supply and Sewerage. Premium of 40l. is offered. If the Engineer whose scheme is selected is appointed to superintend the execution of works, the premium merges into his commission. Mr. David Humphreys, Inspector of Nuisances, Machynlleth.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150l. and 50l., premium to merge. Mr. H. H. Hicknott, Town Clerk.

SOUTHEND-ON-SEA.—Jan. 31.—For Designs for Shelters, Sea-baths, Photographic Studio and Shops. Mr. W. Gregson, Town Clerk, Southend.

CONTRACTS OPEN.

ABERDARE.—Feb. 1.—For Building Baptist Chapel. Rev. J. F. Williams, Brynderwen Villas, Aberdare Junction.

APPLEDORE, DEVON.—Feb. 6.—For the Erection of a Timber-framed Battery and Drill Shed for Royal Naval Reserve. Director of Works, Admiralty, 21 Craven Street, W.C.

BEDWAS.—Jan. 31.—For Additions to Board School. Mr. T. S. Edwards, 29 High Street, Newport, Mon.

BELFAST.—For Building Terrace of Houses. Mr. Henry Seaver, Architect, 128 Royal Avenue, Belfast.

BELFAST.—Feb. 1.—For Building Public Baths. Mr. Robert Watt, 77A Victoria Street, Belfast.

BEXLEY.—Jan. 31.—For the Supply of Paving Materials for Twelve Months from March 25. Mr. Sidney Matthews, Board Offices, Bexley.

BLACKBURN.—Jan. 29.—For Building Pauper Lunatic Asylum. Messrs. Stones & Gradwell, Architects, 10 Richmond Terrace, Blackburn.

BLACKBURN.—Jan. 30.—For Alterations to Board School. Messrs. Simpson & Duckworth, Architects, Richmond Chambers, Blackburn.

BLACKBURN.—Jan. 30.—For Extension of Mill. Messrs. Waddington & Son, Architects, 17 St. Ann's Square, Manchester.

BLACKPOOL.—Feb. 3.—For Making and Fixing Shop Fronts, Windows, Doors, &c., in Walnut, for Shops in St. John's Market. Mr. J. Wolstenholme, Town Hall, Blackpool.

CARDIFF.—Jan. 27.—For Extension of Board School. Messrs. James & Morgan, Architects, Charles Street Chambers, Cardiff.

CARISBROOKE.—Jan. 29.—For Building Boundary Walls for Extension of Cemetery. Mr. W. C. Way, Surveyor, Newport, Isle of Wight.

CONGLETON.—Jan. 27.—For Building Infant School. Mr. J. M. Bannerman, St. Stephen's Vicarage, Congleton.

CORK.—Jan. 29.—For Building Wesleyan Church and Sunday Schools at Barrackton. Mr. Robert Walker, Architect, 17 South Mall, Cork.

CRADLEY.—Feb. 9.—For Building Police Station, Cells, &c. Mr. Henry Rowe, County Surveyor, Worcester.

DEWSBURY.—Jan. 31.—For Construction of Embankments, &c., for Forming Two Reservoirs. Mr. G. H. Hill, Engineer, 3 Victoria Street, Westminster.

DORCHESTER.—Feb. 9.—For Repairs to Premises, High West Street, for the Joint Committee of the County of Dorset. The County Architect, Shire Hall, Dorchester.

GOLBORNE.—Jan. 29.—For Building Methodist Chapel. Mr. W. Graham, 121 Leigh Street, Golborne.

HAMPSTEAD.—Jan. 31.—For the Execution of Works and the Supply of Materials for One or Three Years from March 26. Mr. A. P. Johnson, Vestry Hall, Hampstead.

HANLEY.—Jan. 29.—For Electric Light and Fittings for Corporation Buildings. Mr. Joseph Lobley, Borough Engineer, Town Hall, Hanley.

HORSHAM.—Jan. 31.—For Building Police Station and Weights and Measures Office. Mr. C. Adcock, County Surveyor, 5 Queen's Square, Bognor.

ISLINGTON.—Feb. 6.—For Laying-in 559 Feet Glazed Socketed Drain Pipes and the Construction of a Tank and Filter Beds. Mr. G. W. Woodrow, Burial Board Offices, Vestry Hall, Islington.

LEEK.—Jan. 26.—For Additions to Boys' School. Mr. J. G. Smith, St. Edward Street, Leek.

LLANDUDNO.—Feb. 5.—For Bench of Retorts. Mr. E. P. Stephenson, Engineer to the Improvement Commissioners, Llandudno.

MANCHESTER.—Jan. 31.—For Building Stores, Show-room and Workshop. Mr. C. Nickson, Superintendent of the Gas Department, Town Hall, Manchester.

MANGOTSFIELD.—Feb. 6.—For the Construction of Main Outfall and Branch Sewers, Precipitation Tanks and Filter Beds, Erection of Sludge Pressing Buildings, Chemical Stores and Erection of Sludge-pressing Plant and Mixing Machinery. Mr. S. F. Andrews, Keynsham Union, Keynsham.

MARLBOROUGH.—Jan. 26.—For Providing and Laying Cast-iron Water Mains, Irregular Pipes, Valves, Hydrants and Consumers' Service Pipes. Mr. Ed. Llewellyn Gwillim, Town Clerk, Marlborough.

NORFOLK.—Feb. 3.—For the Supply of Broken Granite for One Year from March 31. Mr. T. H. B. Heslop, C.E., County Surveyor, Norwich.

PORTSMOUTH.—Jan. 30.—For Building Board School for 2,072 Children. Mr. A. H. Bone, Architect, Cambridge Junction, Portsmouth.

RAMSGATE.—Jan. 29.—For Removal of Albion Hotel. Mr. H. B. Hammond, Clarence Baths, Ramsgate.

SALFORD.—Feb. 5.—For the Erection of a Higher Grade School in Victor Street. Mr. Ogilvie Duthie, School Board Offices, Salford.

ST. PANCRAS.—Jan. 29.—For the Execution of Works and the Supply of Materials for One Year. Mr. Charles Worrell, Vestry Hall, Pancras Road, N.W.

STROOD, KENT.—Feb. 1.—For Supply of Convertible Iron and Deal Tables, for the Dining-hall of Union Workhouse. Mr. G. Wilkinson Prall, Clerk's Office, Strood Union, Kent.

THURSO.—Jan. 27.—For Construction of Pier at Island of Strom and at Dwarwick Head. Mr. James Barron, Engineer, 7 Union Terrace, Aberdeen.

WALTON-ON-THAMES.—Jan. 29.—For Laying-out, Enclosing and Draining a New Cemetery, with the Construction of Stoneware Pipe Drains and Sewer. Mr. W. F. Vinter, A.M.I.C.E., 3 Little George Street, Westminster.

WATERVILLE, Co. KERRY.—Jan. 30.—For Building Coast-guard Station. Mr. P. J. Tuohy, Secretary, Office of Public Works, Dublin.

VERITY BROS. CALL LANE, LEEDS.

TRADE NOTES.

At Hebdon Bridge parish church on Tuesday last a large clock and bells, which have been presented to the church by a lady of the congregation as a memorial to her late husband, were formally started by the Bishop of Wakefield. The clock, which is of the best construction, contains all the latest improvements and shows the time upon three dials, each measuring 4 feet across. It is also constructed to chime the Westminster quarter chimes and strike the hours. Both clock and bells have been manufactured and fixed by Messrs. Gillett & Johnston, the well-known clockmakers and bell-founders of Croydon, who have in hand at the present moment the large clock and bells for the Croydon New Municipal Buildings, also that for Messrs. Barclay's Brewery, Southwark, and many others.

At the meeting of the Warwickshire County Council, the tender of Mr. Jacob Biggs was accepted at 1,349*l.* for rebuilding Stechford Bridge.

THE new hospital, Liscard, Cheshire, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

ABOUT ten years ago Messrs. Merryweather & Sons, supplied a powerful floating fire-engine for the harbour of Alexandria to the order of the Egyptian Government. They have now built a still larger boat for the Alexandria Chamber of Commerce. The new "float" is for service on the Mahmoudieh Canal, for the protection of the cotton warehouses which line its banks. It is of steel, and is 60 feet long, 10 feet 6 inches beam, and draws only 18 inches of water. Steam can be raised from cold water to 100 lbs. pressure in ten minutes. The engine is of the "Greenwich" pattern, with two steam cylinders and a pair of double-acting gun-metal pumps. The capacity is 2,000 gallons of water per minute, and there are several hose connections, so as to enable a fire to be surrounded. As the boat is not intended for seagoing work, a means of hydraulic propulsion has been adopted, water being discharged astern through jet pipes, and a speed of four miles an hour being thus obtained. In this way propelling engines, shaft and screw are dispensed with, and a great saving of weight is effected. Hand-wheels enable the jets to be reversed together or separately, so that the boat can be turned into her own length or go astern in a dock or narrow canal.

WE wish to call the attention of our readers to a notice which appears in our advertisement columns respecting Messrs. Leggott & Marsh's system of fuel and smoke consumption, which is applicable to all coal fires, and most economical in prevention of soot deposit, and consequently in cost of chimney-sweeping. We refer readers to the evidence we publish on the part of architects, experts and the public generally, which ought to prove satisfactory.

THE Works Committee of Dundee Police Commission at their meeting had the subject of the west-end bathing-pond under consideration. The convener and burgh engineer reported that the lowest tenders for the construction of a bathing-pond on the site, viz. on the made-up ground immediately on the west side of the ground belonging to the North British Railway Company, amounted to 1,800*l.* 1*s.* 10*d.*, and that the commissioners had already approved of the construction of a pond at a price not exceeding 2,000*l.*

BUILDING AND BUILDERS.

THE Dover Harbour Board (of which the Marquis of Dufferin and Ava is the president) have decided to commence a system of quayside warehouses by the erection of two blocks of commodious buildings at the Granville Dock. The warehouses will provide such accommodation as is required by ocean-going steamers.

AT Glasgow the new wharf for American cattle at Point-house has been formally opened. In the new buildings and the contiguous east lairage 4,000 cattle may be received at one time for inspection and slaughter. The cost of the buildings, with fittings, will be about 40,000/.

THE annual dinner of the Barnsley Master Builders' Association has just been held, Mr. H. Hinchliffe, the retiring president, in the chair, supported by Messrs. W. Dunk (treasurer), E. R. Taylor (secretary), Moore, Bycraft, Lawton, Wright, Foster, Guest, Higham, Porter, &c. Justice having been done to the good things provided, the company proceeded to business. The first item was the election of officers for the ensuing year. Mr. Dunk was elected president, Mr. Councillor Taylor vice-president, Mr. Aaron Wood treasurer, and Mr. F. Walker secretary. Various toasts were then honoured. Mr. W. Dunk proposed "The Building Trades of Barnsley." In spite of discouraging signs, he trusted there would be plenty of work for them in the year which had just opened. He was pleased to think that they had been moderately busy in the year which was past. There had been over 200 new buildings erected during the twelve months, or an increase of more than sixty over the record for the year before. It had been a pleasure to them to work harmoniously with the various architects and with the Corporation officials, a state of things which he hoped would continue.

It is proposed to acquire a piece of land at the junction of Albacore Crescent and High Street, Lewisham, for building a fire station, to take the place of the small and inconvenient one at Rushey Green.

OWING to the liberality of the Fielden family to the town of Todmorden, buildings and land which comprise the new infectious diseases hospital have been handed over to the hospital committee of the Todmorden Local Board on behalf of the joint hospital committee of the Todmorden Union. The hospital comprises four blocks of buildings. The administration block affords accommodation for the staff. Behind this is the principal hospital, in which are one ward for

children with two beds, one for adults with eight beds, and one with six beds, in addition to the nurses' rooms, hall, &c. The isolation block will be used for cases of diphtheria and other highly infectious cases. In this are two wards with one bed each, and two wards with two beds each. The fourth block is set apart for laundry purposes and disinfecting clothing, &c. All the buildings are fitted up in the most approved style, from plans by Mr. John Sutcliffe, architect, Todmorden. The entire cost is about 6,000/., and has been defrayed by Mr. J. A. Fielden, Centre Vale, Todmorden, in accordance with the wish of his deceased father, Mr. Samuel Fielden.

ELECTRICAL.

WE have had the pleasure of inspecting the showrooms of Messrs. Ball Bros. & Bates, electric light engineers, 118 Holborn, E.C. We noticed that a special plant has been laid out on the premises for practical electrical engineering, and a special feature is the showrooms devoted to high-class electric light fittings. Mr. Tatley, who has had considerable experience in contracting work, is in charge of the installation department, and increased business should result from his accession to the firm.

AT the meeting of the Royal Scottish Society of Arts, a paper, read on behalf of Mr. Ramsay Taylor, described a system of electric railway signalling, the object of which was to prevent an engine driver running past a signal set at danger carelessly or in foggy weather. The general description of the apparatus is as follows:—A small electric bell is placed on the engine, near the engineer's head. It is actuated by means of a wire brush so fixed under the engine as to make contact with a conductor laid along the track and connected with the signal cabin. When the signal is put at danger, it automatically completes an electric circuit, which causes the bell on the engine to ring. One of the advantages claimed for the system is that it does not interfere with the existing system of signalling. A working model was exhibited. The paper gave rise to some discussion, chiefly with regard to the difficulty of securing insulation of the conducting wire, especially in wet weather, and the difficulty of fixing the attention of the driver on an engine travelling with great noise at a high rate of speed.

PREPARATIONS are being made in the crypt of St. Paul's Cathedral for the laying of plant for the electric light. The chief difficulties which beset the electricians are the height of the dome and the width of the building. There will have to be

BANK AND OFFICE INTERIORS.

SPECIALTIES:

PANELLING, COUNTERS, DESKS AND STRONG-ROOM FITTINGS.**MANUFACTURED ENTIRELY AT OUR LONDON CABINET WORKS.****ARCHITECTS INVITED TO APPLY FOR OUR TENDERS.****SHANNON FILE COMPANY, LIMITED****(OFFICE AND BANK FITTERS).****Head Offices:—15 & 16 Ropemaker Street, Finsbury Pavement, E.C.****WALL INLET VENTILATOR****WITH INDICATORS****(DARRAH'S PATENT).****Incorrect Indication Impossible. Only One Action.**

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

two sets of lights—an arc light in the dome for architectural effect, and incandescent lights at a level of about 25 feet from the floor. The gas-jets are, it is found, injurious to the new decorations.

VARIETIES.

THE *Glasgow Herald* says:—By the death of Miss Margaret Macfarlane, of Monkshaw, Paisley, a number of public bodies have become entitled to legacies amounting, in all, to 8,950*l.* A sum of 1,750*l.* is bequeathed to the Orphan Homes of Scotland for the erection of another cottage, and 2,000*l.* to the Paisley Infirmary. 3,000*l.* is set aside for bursaries in connection with Glasgow University.

THE London and North-Western Railway Company, it is stated, contemplate spending over 100,000*l.* in alterations and extensions of Crewe Station. Plans involving great alterations have been deposited with the local authorities.

AT Lochee, the Rev. Dean Turner, Perth, delivered a lecture in St. Mary's Hall illustrative of a visit to the World's Fair in Chicago, and other cities in the United States, as well as in Canada. There was a large audience, and the Rev. Father Van de Rydt occupied the chair.

THE Great Western Railway Company propose to introduce an omnibus bill next session for power to create and issue 1,000,000*l.* additional share and loan capital. This capital is required for general purposes and for the construction of nearly thirteen miles of new railways in North and South Wales, and over thirteen miles of railways in substitution for an authorised line connecting their Berks and Hants Extension Railway with their Wilts, Somerset and Weymouth line.

A VESTRY meeting has been held at St. Michael's Church, Stoke Prior, to consider plans and a report on the restoration of the church. The Rev. C. Stockdale, vicar, presided. Plans for the work and a report by Mr. J. L. Pearson, R.A., were submitted and approved. The meeting confirmed the application for a faculty to carry out the restoration, the estimated cost of which is about 4,000*l.*, the whole of which will be contributed by Mr. John Corbett, with the exception of 123*l.* from the Ecclesiastical Commissioners towards the chancel.

THE current number of *Work*, an illustrated weekly journal for mechanics, keeps to the forefront in its special department. The proprietors have once again added to the number of pages and given an illustrated supplement.

ON Wednesday morning another vessel was launched from Earle's shipbuilding yard, for the Great Eastern Railway Company's Harwich-Hook of Holland service. The christening ceremony was performed by Mrs. Van Hasselt, wife of one of the directors of the Holland Railway (the line running from the Hook of Holland), and many members of the Amsterdam Town Council were also present, showing the importance attached to this new service by the city of Amsterdam. This vessel, named the *Amsterdam*, is a steel twin-screw steamer of about 1,700 tons gross register, 302 feet long and 36 feet beam, and when placed on the service will, with her sister vessel the *Berlin* (which was launched on the 10th inst.), be the two largest passenger steamers running between England and the Continent. She is fitted with two entirely separate sets of triple-compound engines, designed to develop 5,000 horsepower, giving a speed of 18 knots an hour. The cabin accommodation of the *Amsterdam* will be similar to that of her sister vessels the *Chelmsford* and *Berlin*. These steamers have all been specially built for the Hook of Holland service, and it is intended shortly to supplement this new fleet with another vessel of similar size and speed.

THE *Railway World*, Philadelphia, says:—Near a railway terminus in Paris the experiment is being tried of paving the street with solid mahogany. The announcement seems to promise a startling instance of extravagance. The report, however, states that the cost will be probably considerably less than ten dollars a square yard. The wood, of very fine texture, is Brazilian mahogany, believed to be of so durable a quality as to fully warrant the outlay. This luxury recalls to memory the fact that a railway bed in Georgia was once ballasted with marble, while a bridge on its track was built of the same precious material. The road ran through hills which were filled with marble of a superior quality, then regarded in the neighbourhood as an ordinary stone, the virtues of which were as yet entirely undiscovered. With its elegant bridge and luxurious ballast, the road probably in a very short time repaid its debt to the locality with a large interest by demonstrating the value of the stone, stimulating a demand, and carrying the marble to a more appreciative market, which it might never have reached without its vigorous intervention.

THE *Medical Press and Circular* says:—"The fact is often overlooked that a damp cellar in a house is a very serious drawback to the healthiness of the residence. Strictly speaking, after the drains, nothing is more important than to ascer-

TO ARCHITECTS, SURVEYORS, AND BUILDERS.

Call, or send for Representative to explain the NEW ELECTRIC CHAMELEON SIGN for FASCIAS, LANTERNS, LAMPS, and HOUSE SIGNS.

SOLE MAKERS—E. L. BERRY, HARRISON & CO.,
Electric Light Engineers, LYRIC CHAMBERS, WHITCOMB STREET, W.C.

tain the condition of the cellar. For the most part, architects are content to pay little or no attention to the sanitary principles which should guide them in its construction." The writer of the above paragraph, evidently through inadvertence, has confounded architects with jerry-builders. All the same, it is ridiculous that such a stale joke should from time to time appear in print, like the perennial sea-serpent paragraphs.

THE February number of the *English Illustrated Magazine* well supports its character as an illustrated periodical. Light matter is judiciously mixed with more serious reading. In "Coster Land" there are many happy hits accompanied by characteristic drawings.

THE thirty-ninth annual report of the Wesleyan Methodist General Chapel Fund Committee states that the committee have sanctioned the erection of 100 chapels, costing 126,753*l.*; 17 ministers' houses, 13,433*l.*; 15 schoolrooms, 12,155*l.*; 120 alterations and enlargements, 60,379*l.*; 83 modifications, 23,950*l.*; 29 organs, 10,049*l.*; total, 246,719*l.* The average cost per sitting in the new chapels is estimated at 4*l.* 11*s.* 9*d.*, which is 13*s.* 14*d.* per sitting less than last year's estimate. Of the new chapels 43, to accommodate 10,272 persons, will be in places where hitherto there has been no Wesleyan Methodist chapels; 57, providing accommodation for 17,356 hearers, supersede former erections providing for 11,035; so that the total gain in sittings, including the gain in enlargements, will be 19,311.

THE Junior Engineering Society celebrates its ninth anniversary by a dinner to be held at the Holborn Restaurant to-morrow (Saturday) evening, the president, Mr. J. Wolfe Barry, M.Inst.C.E. in the chair, being supported by Sir E. J. Reed, M.P., Sir Philip Magnus, Mr. W. H. White, C.B., of the Admiralty; Mr. A. Giles, president of the Institution of Civil Engineers; Mr. A. R. Binnie, chief engineer to the London County Council, and Professor John Perry, F.R.S.

A lift is being erected in the Victoria Tower, Windsor Castle, for the convenience of the Queen when Her Majesty goes out walking or driving. The apparatus is being arranged upon the north side of the building, and is only a few yards from the Sovereign's entrance in the Grand Quadrangle.

THE *British Medical Journal* says:—Dr. Boobyer, of Nottingham, told an amusing story concerning Mr. Justice Hawkins at a meeting of Midland medical officers of health, held at the Birmingham Council House. Mr. Justice Hawkins was at Nottingham on assize business, and at night he noticed

a bad smell in his bedroom at the judges' lodgings. It annoyed him, and with characteristic promptness he got up and had the quiet slumbers of the clerk of the peace disturbed in order that fresh lodgings might be found for him. The incident at the time was thought amusing by all except the gentlemen who lost their sleep, but its after-consequences were serious. On examining the room the drainage arrangements were found to be about 150 years old, and owing to a defective trap a cess-pool ventilated itself into the room. Until then there had been no marked instance of disease arising from this state of things; but four members of the City Council died from disease contracted when inspecting the cesspool.

AMONG the prominent and attractive stands at the Dundee Exhibition of Industries is that of Messrs. John Farquharson & Son, registered sanitary plumbers, brass-founders and gas engineers. Here are to be seen the new incandescent light, Siemens's lamps, gas-saving economisers—exhibited by an ingenious automatic arrangement which shows their value in increasing the illumination. Anderson's patent bye-pass fittings, Parkinson's governor burner, Fletcher's handy pocket burner—tester are attached to a test-meter to demonstrate the hourly consumption of any burner on the observation of one minute. Two highly artistic washhand basins, mounted in cast-iron, and finished in a new patent enamel called "chimatto," which resists all action of either acid or heat, are also on view. In a handsome case is a splendid collection of brass ornaments and castings in aluminium of Royal Arch and Old Custom House, Greenmarket. Samples of metal used in the trade are also shown, and a very fine specimen of Australian lead ore. Gas boiling and heating stoves in great variety and a unique labour-saving gas laundry-stove and irons are also exhibited.

THE directors of the Southport and Churchtown Botanic Gardens and Museum Company, Limited, have recommended a dividend at the rate of 8 per cent. per annum.

AT the meeting of the Midlothian Camera Club, Edinburgh, Mr. A. Scott read a paper on "Marine Photography," illustrated by limelight, with numerous fine examples of this class of work.

THE committee of the Blackburn Rovers' Football Club have completed the purchase of Ewood Park. The club had already spent 3,000*l.* in the fitting of the ground, and they now propose to erect on the south side of the ground a huge covered stand. The ground will be the largest in England, and the accommodation will be equal to nearly 40,000 spectators.

AT a meeting of the Southport Tramways Company, Limited, the directors recommended a dividend at the rate of 9 per cent. per annum for the past half-year.

AN important discovery of coal has been made at Forest Row, Kent, workmen while engaged in sinking a well having come upon a thick seam of coal. This is the second discovery of the kind in the county, a similar seam having been struck in some brickfields on the borders of Kent and Sussex. It is believed that coal exists in large quantities in East Kent, and a committee of county gentlemen has been formed for the purpose of prosecuting experiments, with a view to opening up coalfields.

A SERIES of fine-art plates, produced in collotype, are being prepared for issue with the new serial edition of "Cathedrals, Abbeys and Churches of England and Wales," Part I. of which will be published by Messrs. Cassell & Co. with the February magazines.

THE town of Cleethorpes is already well sewered and paved, and in a good sanitary condition. Its sewers, however, deliver through an outfall sewer, about one mile long, into the Humberstone Beck. The rough solids are first taken out by means of a settling tank. The Humberstone Beck delivers into the sea, but it is tide-locked for a few hours each tide. During this time the sewage backs up the Beck inland. The Humberstone Beck is too far from the town to cause residents or visitors any annoyance, but complaints have been made of the nuisance caused by this arrangement by neighbouring landowners and farmers at some periods of the year. The Local Board have instructed Mr. W. H. Radford, C.E., of Nottingham, to prepare plans of a new iron pipe sea outfall, to take the sewage 1,200 yards out to sea and discharge it near low-water mark. Certain additions will also be made to the flushing, inspection and ventilation arrangements of the town sewers. The works may cost about 4,000*l*.

THE rebuilding fund for Holy Trinity Church, South Shore, Blackpool, has now amounted to 3,500*l*., and steps, it is reported, are being taken for commencing the work next month or early in March.

The *Birmingham Post* says:—By order of the Improvement Committee of the Birmingham City Council, Messrs. Thomas & Bettridge have sold the Winter Garden pavilion by auction. The sale was well attended, and the wood and iron pavilion, which is 170 feet long by 100 feet wide, was eventually sold to Mr. Warden, Edgbaston, for 155*l*.

ELECTRIC LIGHT IN MANCHESTER.

AN exceptionally interesting meeting of the Manchester Literary and Philosophical Society was held on Tuesday, the *Manchester Guardian* says, when Mr. Henry Wilde gave a demonstration of the uses of the Manchester Corporation supply of electricity for illustrating communications to the Society in several branches of experimental philosophy. Not only is it to the generosity of Mr. Wilde that the Society owes the installation by means of which the venerable house where Dalton lived and Joule studied is now illuminated; but, in a much wider sense, it is to him that the Society and the city owe the commercial possibility of the beautiful light which is now rapidly spreading to the shop windows, public buildings, workshops and mills of the district. It was in the early part of the year 1866 that Mr. Wilde invited the Council of the George Street Society to a private exhibition of the powers of a new generator of electricity, based on his discovery of the principle that quantities of magnetism and electricity indefinitely small could induce quantities of those forces indefinitely great. That machine was christened a dynamo-electric machine, a term which has since been contracted to the simpler form "dynamo." Amongst those present on the historic occasion referred to were Dr. Joule, Dr. Angus Smith, Professor Clifton, Mr. Joseph Baxendell and Mr. Binney. The new machine far surpassed any of its predecessors in the luminous and calorific effects produced, but Mr. Wilde frankly told his audience that neither he nor any of those present had any idea that electricity generated by the new method would within the next twenty-eight years be supplied like gas and water by the Corporation of the city of Manchester. Many improvements in the dynamo have since been made by Mr. Wilde and others; but the principle of accumulation enunciated and demonstrated by Mr. Wilde is common to them all, and Mr. Wilde's machine may well be spoken of as the parent of those now in practical use for generating light on a large scale. Later on, in 1868, Mr. Wilde read another important paper before the Society, announcing his discovery of the synchronous rotations of the armatures of a number of dynamo-electric machines, by means of which their united power can be obtained without the use of mechanical gearing, a principle which is being largely utilised in the United States, and is in process of further development at the electro-mechanical power station at Niagara, as well as at lighting stations in this country and on the Continent.

REMEDY AGAINST LEAD POISONING.

AT the Industrial Exhibition held in Bradford, the exhibit of Messrs. E. Walker & Co., of Heckmondwike, from a sanitary point of view attracted special attention. Everyone prefers soft water to hard water, and Yorkshire seems particularly favoured in this respect. Soft water, however, has the serious disadvantage that so many die from its use owing to lead poisoning. Various pipes have been designed to free soft water from the foreign and dangerous elements it acquires by its passage through lead pipes. Iron pipes were previously used as the only alternative. Glass-lined pipes and zinc-lined pipes were next tried, but failed for various reasons to give full satisfaction. It is to the credit of Messrs. Walker & Co. that their "Health" water pipe has been found to be the pipe that was wanted, and that it is in consequence being extensively adopted. Messrs. Walker & Co. are evidently justified in claiming that their "Health" water pipe is the strongest, purest and safest water pipe in the world. This health water pipe consists of a strong serviceable wrought-iron tube, with an internal lining of pure block-tin, so united at the surface as to render it absolutely inseparable by the action of water.

THE Earl of Wharncliffe, when addressing the members of Mappin & Webb's art class, consisting of their workmen at Sheffield, on Wednesday, complained that much of the plate produced in England was offensive in form and ornamentation to a cultured mind, and contrary to true art. He thought the remedy for these defects was in training the craftsman himself to discriminate between good and bad work, and to accomplish this more art classes should be established. He suggested that Sheffield should try and attain distinction in ornamental hammered ironwork.

SURVEYORS' FEES.

AN important action, Beck and Another v. Smirke, was tried before Mr. Justice Wills (without a jury) on Saturday. The plaintiffs sought to recover damages for defendant's negligence as a surveyor and valuer.

According to the *Times* report, the plaintiffs were trustees under a marriage settlement, and in 1889 they had in their hands 1,000*l.* of trust money uninvested and were looking out for an investment. They mentioned it to some surveyors, who said that they knew of a house at Strawberry Hill, Twickenham, upon which the builder, Mr. Hart, was looking for an advance. Mr. Beck saw defendant, told him they were trust funds, and asked him if he knew the value of property in that neighbourhood. The defendant said he was a resident at Strawberry Hill and was well acquainted with the value of property there. It was then agreed that defendant should report upon the property. The defendant reported that the houses in that road were let from 90*l.* to 100*l.* each, that No. 26 was a well-built house, nearly completed, worth 1,800*l.*, and therefore a safe investment for 1,000*l.* The plaintiffs upon this report advanced the builder 1,000*l.* The builder did not pay the interest nor complete the house, owing to financial difficulties. The house, owing to there being no tenant, got into disrepair, and the plaintiffs had to expend 200*l.* upon it. They were also put to expenses in a foreclosure suit and other incidental expenses, making together over 400*l.* The house was sold in July, 1892, by public auction for 810*l.*, and the plaintiffs claimed as damages the difference between that sum and their advance, *plus* all the incidental expenses, amounting to 588*l.* For the plaintiffs evidence of surveyors was given that the value ought to have been estimated upon the letting value and not the structural value. That the fair rental of the house was 65*l.*, and was not a sufficient security for an advance of 1,000*l.*

Mr. Chancellor, estate auctioneer, who sold the house, gave evidence, and said that the sale was a fair one, the letting value being 80*l.* on a three years' agreement, the landlord doing the repairs, and 70*l.* upon repairing lease. It was worth fifteen years' purchase.

For the defence the defendant, Mr. Sydney Smirke, was called, and said he was an architect and surveyor. He went and visited the property on several occasions. He reported on April 18 that No. 26 would be finished in three weeks, and that it required papering. He had several interviews with Mr. Beck. He added to his report that he could not ascertain the rateable

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

value, and that the property was worth 1,800*l*. He told Mr. Beck that the house was unfinished and unlet. He communicated to Mr. Beck that it would take 25*l*. to 30*l*. to finish the house. Mr. Beck said he thought it would be safe to let the builder have the money, and he would deduct 30*l*. as interest paid in advance. Mr. Beck told him that Mr. Breach told him that Hart was not a speculative builder. In March, 1890, he heard Hart was bankrupt, and he went down to see the property and found it terribly wrecked, without any caretaker. On April 25 he visited the premises again. He thought it would take 120*l*. to make the house fit for letting. He visited the houses again in May. At that time the money ordered by the Court of Chancery had not been expended.

Cross-examined:—He arrived at the 1,800*l*. (1) upon rental value; (2) the cubical contents; (3) by comparing it with other properties. He valued the building at 1,400*l*., and the land at 400*l*. He took the 250*l*. as the value of the land before development. He estimated the 400*l*. upon the basis of ground-rent. He arrived at the 1,400*l*. for the building upon an estimate upon the cost price of the building. He did not ask Messrs. Egerton & Breach what they had certified for. It was not the only way of arriving at the value of the house to ascertain what it would let for. He thought the clear rental value was 90*l*. He told Egerton & Breach that he was going to put the rent at 90*l*., and Mr. Breach said that would do. He did not ascertain what the other houses in the road were let for. He estimated the value upon the basis of twenty-two and a half years' purchase of 81*l*. rental.

Two other surveyors were called for the defendant, who stated that they estimated the value of the house upon the basis of twenty to twenty-two years' purchase of the net rental, which they put at 80*l*. It was a sufficient security for an advance of 1,000*l*.

Mr. W. H. Gibbs, of Messrs. Flews & Gibbs, builders, said he had obtained advances of 1,000*l*. upon some of the houses in Strawberry Hill Road built by him. The cost of the house would be about 1,900*l*.

Mr. Barella, the purchaser of the house, was called and said the house was now let at 75*l*. a year, the tenant doing repairs.

Mr. Justice Wills:—The first question was, which way was the verdict to go? As to that he had not a shadow of doubt. A surveyor who was employed had to use competent care in making his report. All the defendant thought was necessary was to ask whether the house was worth 95*l*. a year. He could not see that there was any justification for the statement of

defendant that the houses were worth from 90*l*. to 120*l*., whereas it was stated the rents averaged 80*l*. to 85*l*. The defendant never took the trouble to ascertain whether the tenant or the landlord was doing repairs. The defendant himself admitted in ascertaining the value it was necessary to get the net rental and multiply by the number of years' purchase. The valuation was made in a most careless manner. Even after the person who wanted to borrow said the house was worth 1,500*l*. the defendant brought it up to 1,800*l*., and when it was stated that 1,200*l*. had been spent on the house the defendant brought that figure up to 1,400*l*. Upon the evidence the value for the purpose of borrowing money ought not to have been put upon the house. With regard to Mr. Gibbs's evidence, he was disposed to think that he had been financed by someone, and what that person lent on the houses said to be similar was no criterion here. The fair rental value of the house would be about 80*l*. Sixteen to eighteen years' purchase was much nearer the mark than twenty-two and a half as stated. To say that property such as this was worth twenty-two and a half years' purchase surprised him. The defendant knew he was advising trustees and the margin of one-third was important, as it was meant to cover all sorts of contingencies, of which an auction sale was one. With regard to the damages, the great cause of the loss was that the money was advanced upon an uncompleted house. Upon the defendant was cast the responsibility of inquiring into the condition of the house, not into the financial position of the builder. It was quite plain that plaintiffs were anxious to make the advance, because the defendant said it would be much better that plaintiffs should hold back the money till the house was finished. The difficulties which led to a large portion of the loss were such as ought to present themselves to a lawyer and not to a surveyor, namely, that the mortgagee could not do the repairs without a foreclosure suit. All the expenses of the foreclosure suit and damage to the house it would be unfair to put upon the defendant. The advance and fair charges made up about 1,100*l*. He took 810*l*. as a fair sale price at the time, but he thought the house would have sold better if put earlier in the market, and he would give credit for a little more. He therefore thought if he gave judgment for 200*l*. he would be doing justice in the case.

Judgment for plaintiffs for 200*l*. with costs accordingly.

DR. JOHNSON'S house in Gough Square, Fleet Street, is to be removed in order to use the site for a new building.

LEEDS BUILDERS' EXCHANGE.

THE second annual meeting of the members of the Leeds Builders' Exchange was held on Tuesday. At the opening of the proceedings the meeting was presided over by Mr. Edward Walker, the hon. treasurer, but at a later stage of the business he vacated the chair in favour of the president of the club, Mr. Isaac Gould. On the minutes of the previous quarterly meeting coming up for approval, the secretary (Mr. G. F. Wilkinson) drew attention to certain alterations in the rules affecting the constitution of the committee, and these were confirmed. The report and balance-sheet were then read by the secretary. The former detailed the successive steps by which the Builders' Exchange became a permanent institution, and blossomed into a social club, and then went on to describe the work it had done in connection with the Leeds Consolidation Bill on points which were considered detrimental to the interests of the building fraternity. Especial prominence was given to the proposed clause prohibiting the building of back-to-back houses, and in this connection it was stated that the committee visited Hull at their own cost, in consequence of the laudation of the through houses for the working classes there, but that their careful inspection of these resulted in a conviction that the system prevailing in Leeds was in every way superior to the houses they saw in Hull. So far as the club was concerned, and in the promotion of which the executive freely acknowledged their indebtedness to the generous support given by the firms dealing in building materials, the report showed that it had been a financial success, a dividend of 7½ per cent. upon the paid-up capital having been declared for the past year. Premises had been secured in a most central and convenient position in the city, and these were opened on August 1 last by the mayor, Alderman Ward, whose services on the occasion had been recognised by conferring upon him the honorary membership of the club. The financial statement showed a credit balance on the past year's working of 76*l.* 2*s.* 4½*d.*, and a total surplus of assets over liabilities of 91*l.* 19*s.* 0½*d.* The report and balance-sheet were received with warm approval, and on the motion of Mr. Finney, seconded by Mr. Ezra Stead, they were unanimously approved. The meeting next proceeded to the election of office-bearers, when the president (Mr. Isaac Gould), the vice-presidents (Messrs. Councillor Hannam, B. North and J. Matthews), the hon. secretary (Mr. G. F. Wilkinson), the auditor (Mr. F. A. Holdsworth) and the solicitor (Mr. Walter Foster) were re-elected. Mr. J. Langton was elected hon. treasurer in place of Mr.

Edward Walker, who wished to retire, and the following gentlemen were chosen to form the committee:—Messrs. Kendall, Wood, Edward Walker, J. T. Wright, Denby, Mountain, Bower, Burnell, Blunt, Preston, Carlton, Stead, Walsh, Knapton, Beaumont, Fawcett, S. Atkinson, Frankland, Cluderay and John Walker. This concluded the purely formal business of the meeting, and the members afterwards indulged in a discussion on the various questions affecting the interests of the building trade.

PATENTS FOR INVENTIONS.

A PAPER was read at the meeting of the Civil and Mechanical Engineers' Society by Mr. E. H. G. Brewster, A.M.I.C.E., chartered patent agent, on "Patents for Inventions." The paper gave a sketch of the origin of these patents and a general history of the subject down to the present time. The author then devoted his attention to the subjects of examination for novelty before a patent is granted, and the policy of reducing or not the fees paid by inventors. With regard to the first of these the writer was not in favour of such examination, for although at first sight it did not appear just and equitable for a Government to grant a patent that might be worthless from want of novelty, it was shown that it was impossible for an examiner to be quite sure of an invention being new, for it might easily happen that a manufacturing process, for instance, was being used that he, the examiner, knew nothing of, and a patent be granted for it to a new inventor, or for him to refuse a patent for a valuable invention that might have the appearance of an old one, which old invention had been a failure when tried, while the former was a success. The American system of examination was alluded to, and it was shown that the American people themselves were not, to say the least, particularly in favour of it. The examination as to novelty by the German Patent Office was stated to be more unsatisfactory than the American. The question as to fees was then gone into, and after mentioning the opinion expressed inferentially by the Society of Arts by their Bill of 1882 for the improvement of the Patent Law, which was brought in the year prior to the great Government measure, the author said that it appeared to be to him, as a matter of public policy, advisable not to lower the present cost of a patent, for already a vast deal of rubbish was patented, and it was practically impossible to exclude this by any amount of examination without at the same time killing many valuable inventions, and further, that some of this rubbish might be very hurtful

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

W. DUFFY'S PATENT

IMMOVABLE ACME

WOOD BLOCK FLOORING.

THE PERFECT FLOORING FOR ALL PURPOSES.

in the hands of ignorant persons, for if an individual has to pay a substantial sum for a thing he will think twice before he spends his money, and will consider more carefully and go into the matter more thoroughly than he would otherwise do if the sum he had to pay for it was but a trifle.

SANITARY CONDITION OF THE "BAR LIBRARY," DUBLIN.

THE following report on the condition of the Bar Library, Four Courts, has been prepared by Mr. Thomas Drew, R.H.A.:—
22 Clare Street, Dublin.

It is to be clearly understood that this report does not attempt to recommend an efficient system of ventilation of the library. That is impracticable in its present excessively overcrowded use and wholly inadequate cubic space. The building would require to be at least double its present capacity to provide the minimum that is generally recognised to be consistent with ordinary sanitary conditions.

For an ordinary factory or workshop regulated under statute the conditions issued by H.M. Chief Inspector of Factories and Workshops at Whitehall (appended hereto) lay down that "there must be 250 cubic feet of space for every person employed in a room; when work is carried on after 8 P.M. (with artificial light) there must be 400 cubic feet for each person."

It seems scarcely credible—but it is true—that the Bar of Ireland constantly work under specially unwholesome conditions, with much gaslight, with 190 feet of cubic space for each person, and an allowance of floor equal to 8 1-3 superficial feet.

My attention has, for the present, been directed to an examination whether the system of ventilation, as it is, is any worse than it need be. It is, in my opinion, not only much worse but dangerous to health.

The present limited intake of air is by Tobin tubes in the library, which are supposed to draw their supply of air from a large tube carried up from the basement, the current of which is supposed to be accelerated or otherwise affected by what has been known as an "Æolus waterspray system." Theoretically this system would be effective if, in the first place, the apparatus were perfect, and, in the second, the source of air supply were pure and untainted. Neither of these conditions exist.

The basement vaults under and the sunk areas adjoining

the Four Courts Buildings are at best but fetid and stagnant places. They are traversed by many drains, having various manholes and ventilators. The drains are sluggish or with no fall, close to the surface, and on them the ebbing and flowing tide of the Liffey must act with alternate suction and pressure.

It is from one of these stagnant areas, and in which there is one manhole ventilator, that the main intake of air is supposed to be entirely drawn.

But the conditions are even worse than this. In the sheet-iron tube conveying the air supply there are probably 80 to 100 joints, and few of them are close. It is plain demonstration that there is a strong suction of basement air laid on to the library.

A smoke test applied in the basement on December 28 last had such results that I withdraw recommendations which I made in a preliminary report of December 20. It was found that the whole of the library and the Rolls Court was permeated by the smoke in half an hour after the test was applied. Accordingly, I have limited the operations entrusted to me during this recess to abandoning the area intake entirely and the Æolus air-spray tube, and to take in an air supply from the upper part of the windows of the lower hall. This is connected with the Tobin tubes and gives at least as fresh air as it is possible to take in on the north side of the Four Courts.

The w.c.'s and urinals about the library are unfortunately placed; they seem to be carefully and well fitted, but their ventilation is defective. Some, immediately under the library floor, in connection with the judges' private rooms, have no external ventilation whatever. The library w.c.'s are but top-ventilated, and the higher temperature of the library draws a current of air from them. The attendants' w.c. is also unventilated.

It would not be easily practicable to sever all connection with the basement while the heating pipes from the furnace below are passed up.

The heating coils in the library, which can heat only impure air, appear to me as objectionable as they are unnecessary. The fireplaces, with the overcrowding, are sufficient to keep up a high temperature in rooms the whole cubic content of which does not amount to 60,000 cubic feet.

I should recommend the removal of the coil cases and pipes, and reliance on the more wholesome action of the open fires. Further expenditure on trying to improve the ventilation would be thrown away under present circumstances.

With an enlargement of the library to a fairly sufficient size

only could a healthy and efficient system of ventilation be possible. Its leading principle should be the in-taking of air at some high and untainted level, the distribution of it in cold weather by an active hot-air system of warming (not by hot-water pipes), and the impelling of a current at that time and other times by mechanical power, which is applicable.

SAFETY FROM BOILER EXPLOSIONS.

IN turning over the pages of the catalogue of the Eagle Range & Foundry Co., we find illustrations of the "Eagle Safety Bell for the prevention of explosions in boilers." At the beginning of this month the frost set in with scarce any warning, with an intensity that was almost unprecedented. On other occasions the progress towards intense frost has been generally more graduated. Numerous disastrous casualties and fatal accidents resulted from the many boiler explosions that took place. Public attention has, therefore, been once again directed to the terrible dangers they are content to risk in their own homes. During the last week or so, naturally, there has been much discussion on the part of the public as to how to put their houses in order and do all that is possible to secure entire prevention of boiler explosions. We are sorry, however, to add that such explosions have occurred and can occur without the agency of frost. It is not necessary to describe the many and various ways in which frost causes an explosion. What is to the purpose, however, is to insist on the necessity of a safety outlet, having which there will be no means for steam to bottle itself up to find its own outlet through an explosion. The term "safety valve" is somewhat of a misnomer. They may or may not do good service at times, but as safety appliances no expert could say they are reliable. Theoretically it could be demonstrated that they are a perfect means of securing immunity from boiler explosions; but practically this is too frequently not the case, especially in houses where the ramifications of the hot-water supply are so complex, instead of being arranged on a simpler design, which after all would do duty better all over the house. The Eagle safety bell is a patent of the Eagle Range and Foundry Company. This safety apparatus consists of a gun-metal plug (which can be easily fixed to any boiler) containing a fusible ball. This ball melts at a temperature very much below the bursting point of the boiler, and relieves the pressure at once; it also causes a jet of water to pour direct on to the fire, thus extinguishing it and removing all possibility of further danger.

The fixing is most simple. A hole is drilled in the top of the boiler, and the plug screwed through until it projects inside the boiler about $\frac{1}{4}$ inch; the bell is then screwed up tightly from inside the boiler. When the boiler is filled with water the air becomes pressed up into the bell and compressed more and more, until at a very high pressure from 1 inch to $1\frac{1}{2}$ inch of compressed air is confined between the top of the water and the fusible ball. This strata of compressed air effectually prevents the water coming in contact with the ball, consequently furring or incrustation is entirely prevented. Where the boiler is made without any manhole, the bell is made in one piece, so that it can be screwed through a $\frac{3}{4}$ -inch hole. It is imperative that to secure safety persons must have a reliable safety appliance. One further matter should have attention called to it, viz. that steam pressure can be generated with terrible rapidity under certain conditions, not only in winter, but in summer, as has happened before now, ruin and destruction following without the slightest warning. No better advice can be given than to say that all encouragement should be given to those who do their best to cater for the public safety. The catalogue of sixty pages (illustrated) should also be consulted in regard to specialties of the Company and their well-known ranges, space not permitting to refer to them further. Several pages of extracts from testimonials received from all quarters form a valuable expression of public opinion as to the worth and merit of the appliances.

CITY IMPROVEMENTS.

At the meeting of the City Commissioners of Sewers on Tuesday Mr. Bridgman, the chairman, reviewed the events of the Commission during the year, which, he said, had been one of stern and endless hard work. The body was first constituted the sanitary authority of the City immediately after the Great Fire of 1666. The City, without exception, was the best cleansed and the best paved and the healthiest place in the world. During the past year a widening of Upper Thames Street had been decided upon. A plan to widen the western end of Cheapside, at a cost of 100,000*l.*, was awaiting the decision of the London County Council as to a share of the expense. The approaches to the Tower Bridge were in abeyance for a similar cause. During the last forty-two years the Commission had expended in improvements 4,254,423*l.*, of which the Corporation and the Metropolitan Board of Works

contributed 1,270,789 $\frac{1}{2}$. The artisans' dwellings in Petticoat Square were all filled, the inhabitants exceeding in number 1,000 persons. The cost of clearing the site of the buildings had been 200,915 $\frac{1}{2}$. The rents during the year were 5,466 $\frac{1}{2}$., and the expenses 1,288 $\frac{1}{2}$. There were now 479 electric arc lamps used in the City, costing 26 $\frac{1}{2}$ each, or 12,454 $\frac{1}{2}$ per annum. Experiments had been made in Aldermanbury and Basinghall Street with incandescent glow lamps, with a view to determine the most desirable method of lighting from the centre of the streets, and had also been made in Lower Thames Street. In testimony of the satisfactory progress of electricity in the City, nothing could, the Chairman thought, be more eloquent than the recent decision of the Commissioners to remove the old gas lamps at an early date from the main thoroughfares, which had been maintained at an annual cost of about 1,182 $\frac{1}{2}$ ready for lighting in case of electrical failures. The necessary steps had been taken from time to time by the Commissioners, under the dangerous structure clauses of the Building Act to insure the safety of the public, and only just recently the old wooden structure known as Moorgate Street Station was condemned, but not a moment too soon, and would have to be entirely reconstructed.

REGISTRATION OF PLUMBERS.

A MEETING of the plumbing trade in Ayr and the district has just been held in the Ayr Town Buildings, in furtherance of the movement for the national training, examination and registration of plumbers and with special reference to the proposed plumbing classes at Ayr. The meeting was a large and representative one, and a deputation from the Glasgow and West of Scotland District Council was present. The deputation consisted of Messrs. Archibald Craig, writer, Glasgow, hon. sec. to the District Council; Wm. Anderson, president of the Master Plumbers' Association of Glasgow; Jas. Hogarth, master plumber of Ardrossan; M. Riva, operative plumber of Glasgow. Mr. Cowan, master plumber, was called to the chair.

Mr. Craig intimated that he had received a letter from Mr. C. G. Shaw, county clerk, stating that the County Council had resolved to devote the sum of 100 $\frac{1}{2}$ towards the promotion of classes for plumbers in the county of Ayr. Mr. Craig stated that the District Council which the deputation represented embraced the western counties of Scotland, including Ayrshire,

and consisted of forty-two members—fourteen master plumbers, fourteen operative plumbers and fourteen public representatives. Touching on the educational side of the movement, Mr. Craig dealt with the work done in Glasgow and Greenock, from which it appeared that the classes there were of great value. The County Council of Ayrshire had asked the District Council to submit a scheme, and the District Council had naturally come to the conclusion that the proper place to start operations would be in the town of Ayr. It would be for the meeting to say how they should spend the money. He thought a representative committee should be appointed to make arrangements regarding the classes. The committee could co-operate with the District Council and the classes should be started this winter.

After full discussion a committee was appointed, Mr. Cowan being elected chairman, and it was determined to endeavour to start the classes at once.

The Court of the Company of Plumbers having considered the necessity which exists for the provision of additional facilities for the systematic instruction of teachers of plumbing classes and foremen and inspectors of plumbing-work in the subjects of sanitation, and in such branches of science and practice as are embraced in the proper construction and adjustment of sanitary appliances, have made arrangements with the Council of King's College, London, for special classes of advanced instruction in these subjects. The students to be admitted will be selected by the Company from those who have regularly attended any one of the metropolitan plumbing classes and have passed the City and Guilds of London Institutes' examinations in the theory and practice of plumbing, first class in the honours grade.

Each course will last twelve weeks, and certificates of merit will be given to those who have attended regularly and passed a satisfactory examination. Lectures in each course will be given upon physics, chemistry and sanitation in relation to plumbers' work, and Mr. Geo. Taylor, R.P.C., will teach advanced practical plumbing in the plumbers' workshops at King's College, which have been equipped, under the direction of Mr. S. S. Hellyer, by the Plumbers' Company.

A museum is attached to the workshops, in which specimens of work and apparatus, sanitary appliances, &c., will be shown.

Candidates for admission to the above classes must apply to the Clerk, the Worshipful Company of Plumbers, 1 Adelaide Buildings, London Bridge, giving full particulars of the instruction they have received and of any examinations they have already passed.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3 $\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

CHRIST'S HOSPITAL.

A MEETING of the City Commission of Sewers was held at Guildhall, when Mr. H. H. Bridgman, presided. A deputation, representing the Council of Almoners of Christ's Hospital, and headed by Mr. Alderman Vaughan Morgan, the treasurer, attended to present a memorial relative to the notice in respect of the drainage of that institution. The memorial stated that in consequence of an outbreak of scarlet fever at Christ's Hospital last October, and in accordance with the advice of the medical officer of health for the City of London (Dr. Sidgwick Saunders), the boys of the foundation were sent to their homes, to the great inconvenience and expense of the parents and guardians and the serious educational loss of the boys. The medical officer of health subsequently made a searching investigation into the sanitary condition of the hospital, and reported that nothing short of an entire reconstruction of the general system of drainage would suffice to bring the school into focus with modern requirements, and make it fit for wholesome occupation. His report was adopted by the Commission, and a notice under the Public Health Act, 1891, was served upon the governors requiring them within three months from December 5, 1893, to execute such works and do such things as might be necessary to abate the nuisance complained of. The Council were informed that the work would involve an outlay of from 15,000*l.* to 20,000*l.*—an expenditure which they would not be justified in incurring, as the school would as soon as possible be removed to premises which had been acquired in the country. Moreover, the work would take considerably more than three months to carry out. They had made various inquiries, and had tried to obtain premises in which the work of the school could be carried on temporarily, but they had failed to find suitable accommodation, and in consequence the school was unable to reassemble, and further hardship to both parents and boys would follow. The council believed the health of the children would be better in Newgate Street than in temporary premises. In support of that opinion they referred to the testimony of Dr. Andrew (their physician since 1879), Sir William Savory (their surgeon since 1871), the health report of the school (which would be found to compare favourably with that of any other school of like size in the world), and to the fact that during the last twenty-four years there had been but twelve deaths among the

boys at the school, only one of which—occurring in November 1890—could be attributed to the hospital drainage, and that was when a drain was opened in special circumstances. In seven of the twenty-two recent cases of scarlet fever the illness was not contracted at Christ's Hospital, and in six of the others the patients were the staff and not the boys. In only one of the whole twenty-two was the cause attributable to the drainage. None of the cases presented dangerous symptoms or any suggesting defective sanitation. In these circumstances, and in view of the insuperable difficulties experienced by the governors in finding suitable accommodation elsewhere, the Council of Almoners hoped the Court would withdraw the notice served upon the governors, in order that the hospital's site in Newgate Street might be used until the new boarding-schools were erected. They presented, too, a report of proposed alterations in the drainage which, in their opinion, would render Christ's Hospital fit for occupation.

Mr. Alderman Vaughan Morgan said that the Duke of Cambridge, the president of Christ's Hospital, had intended to have been present to head the deputation, but had been called abroad. He hardly thought that had the whole facts been known the Commissioners would have pronounced the cruel decree of banishment against the school. The governors sent the whole of the boys home, and in many cases to very poor homes, and there they had remained since October, greatly to their detriment in every way. The buildings of Christ's Hospital in Newgate Street could only be used for a short time as, under the scheme of the Charity Commissioners, the whole school was about to be sent into the country, and it was therefore impossible, as well as wasteful, to ask the governors to spend 20,000*l.* to patch up these existing premises for a few months or years, knowing that at the end of that time they would be devoted to some other use, and probably to a use where drainage in a residential sense was unnecessary. They had gone everywhere to obtain a temporary school, but wherever they went the sanitary conditions were infinitely worse than at Christ's Hospital. He hoped that the Commissioners would sanction the modified plans, so that the school might return for a time to their old building pending their final removal to Horsham. As a boy himself at Christ's Hospital, and as a resident for the last few years as treasurer, he could say that the Newgate Street school was one of the healthiest places in the world.

The memorial was referred to the Sanitary Committee for consideration and report forthwith.

USES OF ELECTRIC FORCE.

AT the meeting of the Manchester Literary and Philosophical Society, at the Society's house, 36 George Street, Professor Schuster in the chair, Mr. Henry Wilde, F.R.S., gave a brief history of the dynamo-electric machine, and an account of his discoveries, which have had so important an influence in making possible the commercial supply of electric light and power on a large scale by the Corporation of the city of Manchester. He also gave experimental illustrations by means of the installation which he has presented to the Society of the uses to which the supply may be put in philosophical research. Of the many scientific uses and manifestations of the electric force Mr. Wilde enumerated the following:—(1) The arc and incandescent light, (2) heating wires and inferior conducting substances, (3) energising induction coils and producing electric oscillations, (4) the excitation of powerful electric magnets, (5) the action of magnetism on gases, (6) diamagnetic polarity and magnecrystalline action, (7) reproducing the phenomena of terrestrial magnetism, (8) demonstrations in spectrum analysis, (9) conversion of electricity into mechanical work, (10) electrolysis of chemical compounds, (11) reduction of refractory substances in the electric furnace, (12) the artificial formation of minerals, (13) demonstrations in biology and physiology, and (14) lantern projection for microscopic and other objects.

THE BIRMINGHAM TOWN HALL.

A NUMBER of the citizens of Birmingham interested in musical gatherings in the Town Hall have met the Estates Committee, for the purpose of discussing the general question of the Town Hall draughts and the best means of remedying the existing grievances. Councillor Jacobs presided, and explained the object of the meeting. The Estates Committee were anxious to please the public in every possible way. They had spent a large amount of money in improving the system of ventilation, and if the people who engaged the hall would only carry out the instructions properly there would, it was believed, be very little to complain about. Mr. J. A. Cossins, architect, had advised them all through as to what should be done, and he received assistance from the late Mr. Phipson, an authority on the ventilation of large buildings. Moreover, the curator of the hall was a man who thoroughly knew his duties in heating and ventilating the hall. The system adopted was very complete, and, with ordinary precautions, satisfactory. They had hot-water pipes, an engine which drove a large fan, and the latter

in its turn forced the hot air into every part of the hall. The temperature that afternoon was 60 degrees on the floor and 58 degrees near the ceiling. The gas jets in the windows were valuable adjuncts to the heating apparatus, for they killed the cold air that came from the twenty-eight or thirty windows into the hall. Double windows had been suggested, and they would be very useful in keeping out the draughts, but the cost of providing a set of stained-glass windows would be about 3,000/., a sum which the committee would not be warranted in spending. Those who gave concerts in the Town Hall had very few complaints to make about the draughts, but the complaints chiefly came from those who had the hall free. The Mayor lent the hall to charitable associations and musical associations, but on such occasions it was hardly fair the ratepayers should pay for the warming of the building. If the Mayor gave people the free use of the hall they certainly ought to pay for the lighting and heating. The heating only cost about 15s., and if those who had the hall chose to have the gases in the windows lighted the total cost would only be a sovereign. But the people who had the hall free would not pay the sovereign. If they would only pay a sovereign and allow the curator to warm the hall properly, then there would not be half the complaints about draughts. A great many of the complaints were imaginary, and some real. He was anxious that concert-givers and all who engaged the hall should let the door-keepers and the men generally be under the control of the curator, Mr. Bevis, who knew exactly what to do and how to do it. If those men were under the control of the curator, and obeyed him as to closing the doors and other matters, the audience would be comfortable. It was not the draught the general public complained of; what they suffered from was the cold caused by the people who engaged the hall being unwilling to spend a sovereign to have it warmed.

Mr. J. A. Cossins said the draughts would never be wholly avoided until the windows were glazed. He recommended double windows, but they would be very expensive to put in and expensive to keep clean. So far as the ventilation was concerned, the air was pure, whether it was warm or cold. He believed there would be very few complaints if people who engaged the hall left the warming and lighting in the hands of the curator.

Mr. Percy Harrison said that at his concerts his employes always kept the doors closed, and he had very few complaints of draughts. He did not consider there was any necessity for

a very large outlay in respect to the ventilation. There was quite sufficient air in the hall, and since the gas had been superseded by the electric light matters had improved. He should strongly advocate the double windows if the expense were not so great. He recommended that the gases in the windows should be continued all round the hall, believing that that would be an improvement.

Mr. Stockley said that if the arrangements of the hall were properly attended to there would be nothing the matter. He had been connected with concerts at the Town Hall for thirty-eight years, and he never once caught cold at a concert. There was a great draught in the orchestra, but if the hall at the back of the organ were warmed he thought the draught would be considerably reduced.

The company then inspected the hall. The heating apparatus was explained, and it was considered perfectly satisfactory for warming the building. It was not thought there would be any complaint in the galleries or on the floor if the doors were kept closed, but there was a strong draught in the orchestra even when the doors and windows were shut. Various suggestions were made, and there was a general opinion, shared by Mr. Cossins, that this draught was caused by the cold air in the organ. The air became cold by reason of the immense body of cold metal of which the organ was constructed, and it then descended from the instrument to the orchestra and made the occupants uncomfortable. This, it was thought, could be remedied without much difficulty, and Councillor Jacobs said the committee would be glad to have the matter attended to as soon as possible.

TECHNICAL EDUCATION AND IRONWORKING.

At the meeting on Saturday of the South Staffordshire Iron and Steel Works Managers, the president, Mr. James Roberts, delivered an address. In the course of it he considered technical education. In these days, he said, he would be a bold man who ventured to say that technical education was unnecessary to the highest form of success. It was not by any way the sole, or possibly the chief means, yet it was that portion of a modern education which enabled a man to do the best work when combined with the knowledge acquired by practice. There were various forms of technical education, such as that given by the science and art and evening classes, that had come into force by virtue of the Technical Education Act passed by the late Government. Whilst this in itself was

a step in the right direction, he was afraid that from the superficial way it was administered very little lasting good was done. Too much was attempted and too little really accomplished. It was almost an impossibility to teach a range of subjects such as metallurgy, light, heat, steam, acoustics, &c., by one man, who, at most, could only have a very superficial knowledge of all of them. Instead of multiplying these technical education schools until there was an efficient school attached to almost every Board school, it would be well to group districts together and form, under the best possible science masters, a really efficient school, where the young lad or the apprentice could attend in the evening and carry on the work without any restriction as to age so long as he made himself efficient. That they had such centres as Masons College at Birmingham, Sheffield Technical Schools and similar institutions at Liverpool, London and other places, was a great thing in itself, but it would be better for the ordinary artisan if these schools were to be supplemented in the manner he had indicated. Having recognised the advantage of a technical education, it was the duty and ought to be the pleasure, of every member of that Institute of Managers to do everything in their power to see that these efficient schools were founded, and then to use their persuasion with the parents of the children and the young men themselves, to urge them to attend and fit themselves for the more important duties of life. Many parents said, "Oh, I don't see what he wants to be taught about science for; I'm a practical man and have done fairly well, and why shouldn't he?" Because in these days they moved quickly, competition was keener, and the race was not with the strong, but the keenest intellect. For a man to have an intimate knowledge of the material upon which he was working, of its chemical composition, structure, and of the various effects of heat applied to it, would often be the means of not only saving himself a lot of what would otherwise be wasted energy, but also enable his master to make a small profit instead of a loss. The men in the future who would be selected as foremen, managers, &c., would be those who had studied both the technical and practical side. On the other hand, there was possibly a danger of making too much of technical education. The theory of science was perfectly true as it was stated, and when performed as a laboratory experiment, but when it came to the application of theory to manufacture then there were so many circumstances that operated against the perfect theory that a practical knowledge was necessary to duly weigh the case and get a good result, and a

far better result from the combination of the two than could be obtained from either of them taken singly. They prided themselves on being practical men, who could see the advantage of technical education and apply it when obtained. This subject had a far-reaching effect on the future. They must remember that Germany and France had both been far ahead of us in all matters of technical education, but until the last decade had not had the advantages of the practical side of the question. Now, however, they were fully up to English practice, and with the help of their scientific attainments would run them very hard, unless they bestirred themselves, and saw that the rising generation received the best technical and practical education it was possible to give them. Let their advance be side by side. They must not make the mistake of sending their sons to college until they were of age, but see that they did a certain amount of practical work in the shops, and attended the science classes at the same time. Let them have the advantage of learning the theory, and in their daily occupation apply it to practice. However little theory they might have learnt, the mere chances of testing it practically would be a strong inducement to them to go still deeper into the theories of science, and thus they would be led, as it were, almost insensibly, to assimilate the theoretical with the practical in such a way as would lead to the best results. It might, he thought, appear from the tone of his remarks that he was somewhat severe on the purely technical colleges. He fully admitted that they owed a very great deal to them, and to their labours was due much of what was known and practised in metallurgy. At the same time, there appeared to him to be a danger lest the youth of this country should imagine, because they were well up in all the subjects taught at those schools, that they ought to be able to manage works and men; and often, he was afraid, their parents were doomed to disappointment that they could not immediately earn large sums when they had these attainments. That they must have a certain number of men to devote their lives to concrete science, and that these schools were the fields where they would be produced was true; but what we, as a manufacturing nation, wanted was the man who had been brought up in works, plus any amount of theory and science that could be acquired at the same time. This, he believed, would lead to the most successful result, and he asked them to see that the means of acquiring this science was put in the way of every young man in the manner most like to achieve the purpose they had in view, namely, by the adoption of really good schools where each branch should be thoroughly taught,

instead of the multiplication of so-called science classes, which were essentially merely elementary, and as such almost a waste of the ratepayers' money.

BIRMINGHAM MEAT MARKET AND SLAUGHTER-HOUSES.

TWENTY-THREE Birmingham firms of architects have, the *Birmingham Daily Post* says, been invited by the Markets and Fairs Committee to send in competitive sketch plans for the new meat market and slaughter-houses. The designs have to be sent in to the town clerk by March 10, and three premiums are offered, namely, 100*l.*, 50*l.* and 25*l.* The adjudication will be made by the committee, with the assistance of Mr. J. Murgatroyd, F.R.I.B.A., of Manchester, who was the consulting architect in the case of the designs for the new Technical School. A plan of the site, lying between Bradford Street and Cheapside, has been furnished to the competitors, together with instructions, from which we quote the following particulars:—The committee estimated that the sum of 40,000*l.* should suffice for the total cost of the buildings, &c., such amount to include gas, water (hot and cold), ventilating, sewerage, gear and all permanent fittings (but excluding refrigeration and pumping machinery and electric installation), but each competitor must give his own estimate of the cost. A general description of the materials, methods of construction, paving, ventilation, &c., is to be sent in with the plans. It is suggested that the inside walls of the meat market should be faced with white glazed bricks to a height of at least 7 feet and of all slaughter-houses to a height of at least 8 feet. The buildings to be provided are:—(A) The meat market. This should be a building extending from Bradford Street to Cheapside, and should be about 90 feet wide, and lighted principally from the roof. Roadways and footways should be provided for according to the plan, with entrance to the stands from the roadways on the site. The glazing should be as far as possible vertically arranged and not on the slopes of the roof. Fittings and hanging gear to be provided according to the most modern system, such as the latest in use in Smithfield Market, London, and to be so arranged as to be capable of being worked in conjunction with the slaughter-house gearing. Provision should be made for the erection of offices for salesmen over the central stands in the market, if and when required. (B) Slaughter-

Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

houses for wholesale butchers, about twenty in number, as shown on plan, and measuring about 18 feet wide by about 20 feet deep. These should be separated from the market by a covered cart-roadway, well ventilated, about 21 feet wide, but all must be put in connection with the market by overhead travelling gear, such as in the Birkenhead Corporation slaughter-houses. In arranging for the gear in each slaughter-house, provision must be made to allow of two beasts being slaughtered at the same time. The slaughter-houses should not be separated by internal walls, but by strong iron bars or lattice-work. Small railed pens for placing cattle in previous to slaughter should be provided outside each slaughter-house. Arrangements to be so made that the animals may be brought into the slaughter-houses without being brought into the roadway on the market side. (C) Lairage for about five hundred sheep and two hundred beasts. This should be provided over the slaughter-houses, projected over the railed pens last mentioned, and should be in the form of one or more open halls, divided off into pens for sheep, tying-up spaces for the beasts, and approached by means of inclined ways from the yard at the rear of the slaughter-houses. (D) Slaughter-halls for retail, &c., butchers. These should be three in number, to cover not more than 2,000 yards of land, with accommodation provided above for storage of fodder, &c. (a) One for beasts, with all necessary overhead travelling gear for use in hoisting and dressing the carcasses. (b) One for calves and sheep. (c) One for pigs, with arrangements for hot and cold water vats, &c. Lairage for animals to be slaughtered in these halls to be provided for, which, if necessary, may be above portions of the slaughter-houses. (E) A department for the storage or collection of ropes, fat, hides and skins, and for blood separation (but not albumen manufacture); also for tripe dressing and boiling. It will be necessary for hot and cold water to be provided throughout the premises from elevated tanks. The two slaughtering departments may be connected by a subway if found necessary. (F) Cold stores. The storage chambers should be arranged as a basement to the meat market, with approaches by subways or inclines, and with several openings for hydraulic lifts into the upper market. The storage space should be in several distinct compartments, and so that they may be refrigerated either separately or together. From 250 to 300 square yards of space should be provided. (G) Engine and machinery department in basement. This should include the provision of a deep well, a boiler-house, an engine and dynamo-room, a small store-room

and repairing shop, a machine-room for the reception of the refrigeration tank and machinery. It is probable that the cold dry-air system of cooling the chambers will be adopted, but the design and arrangement of the machinery does not form part of the present competition. Provision is also required for a small mess-room adjoining the offices, for Corporation market employes, and a mess-room for slaughtermen, &c. Closets and lavatories to be provided, on different parts of the site, for the use of tenants of the market and their servants and persons attending the market. A room for the apparatus for destroying condemned meat.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 374. Fred. Flatman, for "A device for attachment to graduated inch rules, whereby more minute."
- 395. Samuel Hill and George Mackie, for "Improvements in fastenings or catches for windows and doors."
- 426. John George Aulsebrook Kitchen, for "Improvements in or relating to wire joints or connections."
- 463. Peter Kemp, for "Improvements in window-sashes."
- 465. Daird Aitken, for "Improvements in and relating to window-sashes."
- 486. Edward Thomas, for "An improved fire-escape."
- 503. Ray Gaul, for "Improvements in apparatus for producing a draught in smoke stacks and chimneys."
- 540. George Henry Hughes, for "A safety-plug for preventing explosions of hot-water boilers and hot-water apparatus."
- 542. Percy Stuart Green, for "The frozen-pipe-burst-preventer and rapid thawer."
- 637. Oscar August Berend, for "Improvements in air-valves."

SPECIALTIES—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 293. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

VARIETIES.

IN acknowledgment of the public services rendered the town of Llandudno by Dr. James Nichols, he has been presented with an address and a purse of 500 guineas. He has announced his intention of presenting the money towards the fund for enlarging the cottage hospital, which is named after his wife.

THE *City Press* says:—What is described, probably not without good reason, as the finest goods station in London, is just being completed at Farringdon Street by the Great Northern Railway. The site is the square plot of ground facing the entrance to the Metropolitan Station at Farringdon Street, and bounded by Charles Street on the north, Farringdon Road on the west, the new Fruit and Vegetable Market on the south, and the Metropolitan Railway on the east. The works have up to the present been carried on almost entirely underground, and the amount of excavation which has been entailed may be described as enormous. In order to make connection with the existing Farringdon Street depôt, which stands alongside the passenger station, a bridge consisting of steel girders and stanchions had to be constructed underneath Charles Street (which is the name of the little cross street in which Farringdon Street Station stands). So far as the excavation is concerned, the work is now complete. The whole of the buildings are to be lighted by electric light.

At the Free Public Library and Museum, Bootle, the principal librarian, Mr. J. J. Ogle, delivered a lecture on "Insects destructive to Trees and Timber." Mr. Ogle gave an interesting sketch of the growth of trees and the formation of wood, and spoke at length on "insect life," and the changes

which they undergo from the egg through the grub state into the perfect insect. The destruction of the wood by these insects, he said, was generally begun whilst the trees were still growing, but it was by no means confined to that period, for once some of these insects attacked a living tree they continued to develop and multiply after it was cut down, and if effectual means were not used by importers and others to destroy them they would speedily devour some kinds of wood and make them quite useless.

THE *Birmingham Post* says:—The certificates now being issued to the successful candidates at last year's council examinations of the Midland Institute have been specially designed by Mr. Walter Crane. The letterpress is surrounded by the branches of a tree springing from the fountain of knowledge, at which doves are drinking; aspiring souls are seen in various stages of ascent, one of whom has succeeded in securing the fruit. The lamp of truth shines among the topmost branches of the tree.

UNDER the Omnibus Bill, which the Midland Railway Company will introduce into Parliament next session, power will be sought to raise 600,000*l.* additional capital by the issue of new ordinary stock, and to borrow upon debenture stock a further sum of 200,000*l.* The whole of this capital is proposed to be expended on widenings and improvements at St. Pancras, in the construction of about 1½ miles of junction railways in Yorkshire, in the acquisition of additional lands in Nottinghamshire, Derbyshire and Yorkshire, and upon improvements on the Eastern and Midland Railway in Lincolnshire.

AT the meeting of the London County Council on Tuesday, the chairman of the Works Committee submitted a table showing the estimated and actual cost of fourteen completed works. It proved, he said, that the Council had not done an unwise thing in instituting the department through which they did work for themselves. Nine out of the fourteen works were done at less than the estimated cost by the engineer or architect, while only four exceeded that cost, and two by a very small amount. On an estimated expenditure of 20,911*l.* an actual saving had been effected of 2,646*l.*, or 12½ per cent. Consideration of the report was deferred.

THE Worthing Town Council have voted a sum of money not exceeding 200*l.* to enable the French scientist, M. Hermite, to test his experiments upon the treatment of sewage with electrolysed sea-water. The inventor claims by this process of electrolysis to decompose, dissolve, bleach and render perfectly inodorous and innocuous actual sewage matter, and to

destroy all microbes. The members of the Institute of Preventive Medicine have requested Sir Henry Roscoe and Dr. Ruffer to test the result, both chemically and bacteriologically.

IN New South Wales the practice appears to be increasing of giving contracts for labour without materials. The following advertisement from a Sydney journal shows that public departments have adopted the principle:—"Separate tenders (labour only) for carpentering, plumbing, slating, plastering and painting are invited for the erection of a weatherboard cottage residence for the principal of the Hawkesbury Agricultural College. Plans and specifications may be seen at the office of the Chief Clerk, Department of Agriculture, Macquarie Street, Sydney; or at the College, Richmond. The lowest or any tender not necessarily accepted."

ROTHLEY TEMPLE, in Leicestershire, the birthplace of Lord Macaulay, has been sold by private contract for over 40,000*l.* by Messrs. Hampton & Sons, London. The lot disposed of includes the mansion, Knight Templars' chapel and crypt, and manorial rights, with about 900 acres of land.

THE *Newcastle Journal* says that the trustees of the late Lord Crewe have sold to Lord Armstrong, subject to the approval of the Charity Commissioners, the Castle of Bamborough, together with some adjacent land and houses. The castle stands on an almost perpendicular rock looking over the sea—formerly a fortress of might, now a house of charity. Since 1720 it has been used for the Bishop Crewe's Charity, and it has been kept in good repair, much of the old ruin being restored and converted to charitable uses. The castle is also used for signalling purposes. To sailors on that perilous coast Bamborough Castle is what the Convent of St. Bernard is to the traveller on the Alps.

THE annual dinner of the Association of Master Painters of Scotland and the Glasgow Master Painters' Association has just been held in the North British Station Hotel, Glasgow. Mr. Hugh McCulloch, president of the association, occupied the chair.

FOR several years the tenants of Ashwick Court, Shepton Mallet, the residence of Dr. Newton Wade, have complained of the fouling of the well whence the supply of water for domestic and other purposes is obtained. During the drought last year the cause was discovered to be petroleum oil, of which a considerable quantity was obtained from the well. In pumping out the oil lately the quantity of oil increased.

A SCHEME has been formulated by the Midland Railway Company for the widening of their line through Camden and Kentish Towns. At present all the traffic, both main line and suburban, is worked by one pair of rails to Kentish Town, whilst the accommodation at that station, as well as Camden Town, is very limited in extent. By the new scheme the suburban passenger lines from the city will be carried alongside the main passenger lines, and new stations will be constructed at Camden Town and Kentish Town, and an entirely new line will be made from Kentish Town to join the Tottenham and Hampstead Railway, doing away entirely with the present objectionable junction with the main passenger line and with the level crossing on the goods line. The plans show that a large area of land is proposed to be taken for an enlarged and convenient station at Kentish Town.

NOTHING could be more gratifying to the organisers of "Constantinople" at Olympia than the success that has attended their genuine efforts to please. The pageant on the lake, reflecting from its green bosom the fairyland of the immense stage, gives a charm to the whole. While the last tableau still holds the boards, there comes from the canal through which caiques with their Turkish boatmen carry passengers to the Watery hall of 1,001 columns, a procession of eight galleys, a dream of ancient Carthage, Egypt, Rome, Tyre and Sidon. The first galley bears a representation of the reception of the Queen of Sheba by King Solomon, with winged bulls of Assyria at the prow of the vessel and Eastern maidens in flowing white robes holding fans of ostrich feathers above the King's head. Antony and Cleopatra are in the next galley. The Empress Theodora fills one with truly Byzantine splendour. Constantine, founder of the City of the Golden Horn, occupies another, with his Court. The next is devoted to a tableau called "Salamambo, the Mystery of the Sacred Veil." "The Glories of Mahomet II." blaze on the sixth. The seventh shows the victorious Moors in Spain. The last bears representatives of those tough opponents of old-time Turks—the Knights Templars. Every galley is low in the waist and high at poop and stern, after the old pattern. Their slow and stately progress round the lake is apparently due to picturesque oar-like bakers' shovels, handled by picturesque rowers.

THE *Manchester Guardian* says:—The works in connection with the supply of hydraulic power in the city have made satisfactory progress, and although February 1 was the time fixed for the commencement of the supply to the public, the Waterworks Committee felt themselves in such a forward state that

they turned on the pressure in the mains previously, and the first connection was made for working a hoist at the new warehouse erected by Messrs. John Noble & Sons, Limited, Piccadilly.

At Methil a new dock will be commenced about the beginning of March. Space is being at present cleared for placing the contractor's plant. The dock, when finished, will probably be the most complete of its kind on the shores of the Firth of Forth, having all the latest improvements in machinery for the shipment of coal and for the general working of the dock. The dock will have an area of 7 to 8 acres, with a depth of 28 feet of water on the sill.

THE *City Press* says the numerous friends of Sir John Monckton will be gratified to learn that the movement started in the City for recognising in some permanent way the services rendered by him as Town Clerk during the past twenty years has been received in all quarters with the utmost favour. It is suggested to offer to the Corporation a marble bust of Sir John for exhibition at Guildhall, and to present some agreeable souvenir to Lady Monckton.

A LOCAL GOVERNMENT BOARD inquiry has been held at the Town Hall, Uxbridge, with reference to a loan for works of sewage disposal. Mr. Garner, solicitor to the Board, explained the reasons for the application for the loan, stating that it included the construction of precipitation tanks for the ferrozone treatment, six Polarite filter-beds, together with sludge pressing machinery, air-compressing plant, and engine with pumps for raising the sewage. General Carey expressed himself well satisfied that the scheme was a good one, and it is intended to proceed with the work almost immediately.

THE Bromyard Rural Sanitary Authority have decided to erect a hospital for infectious diseases. The structure is estimated to cost something like 1,250/. In addition to the wards there will be outhouses, washhouse, fumigating-room, &c. The Sanitary Authority applied to the Local Government Board for permission to borrow 1,250/. for thirty years.

BUILDING AND BUILDERS.

THE Rochdale Theatre Royal and Opera House has been destroyed by fire. Within an hour the building was quite burned out. The damage, which is estimated at 10,000/., is covered by insurance. The theatre was built in 1867.

ONE of the largest fires that has occurred in Oldham for a

considerable time took place at the Rye Spinning Mills, and the flames, fanned by a gale, spread so rapidly that two mills were burned to the ground and some adjacent property destroyed. The loss amounts to over 80,000/.

THE Mineral Waterworks at Chislehurst have been destroyed by fire. The damage is about 3,000/. The premises were partly insured.

A BLOCK of buildings, comprising five lock-up shops, a temperance hotel and a temperance hall, at Port Erin, has been destroyed by fire. The damage is estimated at about 10,000/.

NEW classrooms, lavatories and cloakrooms are about to be erected at West Cornforth Schools, for the Cornforth U.D. School Board; and new classrooms and other alterations at Peases West Schools, for the Crook and Billy Row U.D. School Board, both from designs and under the superintendence of Mr. H. T. Gradon, architect, Durham.

THE *Liverpool Courier* says a start has been made with pulling down the old buildings in the block bounded by King Street, John Street, Church Street, and Lord Street, Douglas. Fifty men are engaged under Mr. Taylor, town surveyor. The cost of acquiring the old property is about 13,000/. in excess of the estimate.

THE historic Gray's Inn Chapel has been reopened. During the alterations, which were carried out under the direction of Mr. Shoppee, the architect, two three-light Tudor windows and a holy-water stoup were found embedded in the south wall; these are now left exposed. The pulpit is of carved oak, and has been in use from the reign of Elizabeth.

TRADE NOTES.

ON the 26th ult. Easton, Anderson & Goolden, Ltd., was registered, being an amalgamation of Easton & Anderson, the old-established engineering firm, of London and Erith, and Messrs. W. T. Goolden & Co., electric engineers, Woodfield Works, Harrow Road, London. The former firm, who for so many years have had an extended connection in hydraulic and general engineering work, have more recently been paying attention to the development of electric transmission. In their Erith works for some four years travelling cranes of 15 and 20 tons have been at work, driven electrically. A special department has been established in their works for the execution of various electrical work. The firm of Goolden & Co. have been

"SPHINX" PORTLAND CEMENT.

112 lbs. per bushel. Slow setting; test 1,000 lbs. to 1½ inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

Specially adapted for Concrete Floors & Street Paving. "ECLIPSE" PORTLAND CEMENT, Quick-setting; test 3 parts. Standard Testing Sand, 250 lbs. per square inch; 28 days. The finest, most plastic, best sand-carrying and cheapest Cement in the market.

prominently before the public in connection with the application of electric transmission in mines. The nature of the electrical work of each firm being so similar, the combination of the two should lead to an increase of business on either side, as the new company will be in a position to carry out in its entirety all the work in connection with a large electrical installation, either for transmission of power or for lighting. Mr. W. T. Goolden and Mr. L. B. Atkinson join the board of Easton, Anderson & Goolden.

THE Gower-Bell telephones have proved themselves thoroughly satisfactory and reliable in working. The manufacturers, the Consolidated Telephone Construction and Maintenance Company, Limited, have received many testimonials. Among others is one from Messrs. Thomas de la Rue & Company, dated September, 1893, saying:—"The telephones bought of your company in 1881 are still in use here and working satisfactorily."

IMPROVEMENTS IN DUBLIN.

A LOCAL GOVERNMENT inquiry is being held in Dublin respecting a scheme for the erection of artisans' and labourers' dwellings in the area lying between the cathedrals of Christ Church and St. Patrick's. The project had been originated by a deputation of ratepayers representing the Ratepayers' Improvement Protection Association, who waited on the Council on Monday, February 1, 1892. The deputationists represented that there was a probability of the whole of Woodquay Ward becoming derelict if the state of affairs was allowed to continue. One of the streets in the ward—Wood Street—at present had only three houses, although once a street of importance, and in Golden Lane about half of the houses had been demolished. Bride Street was in the same condition. Patrick's Close and Bull Alley had also become depopulated and dilapidated. And in Nicholas Street and other localities a great number of houses had fallen. Altogether 390 houses had been demolished, with the result that 10,000 inhabitants had left the district. Artisans' dwellings were badly wanted in the district. The committee, before bringing in their report, had visited the locality and found large tracts on which there was no longer a vestige of former dwellings. Many houses were roofless and crumbling away, and few remained capable of being restored and adapted as habitations for human beings. A wide area adjoining the north of St. Patrick's Cathedral had been acquired by the Queen's Jubilee Celebration Com-

mittee, who contemplated transforming it into an open space for recreative purposes. The traders in the ward, and those interested in its prosperity, did not favour that project; they thought that the ground should be utilised as a site for healthful dwellings, which would admit of the return of the population that was driven off by exigent circumstances. There was, in the opinion of the Committee, a pressing need for house accommodation in the locality. The unfenced spaces were being made repositories for all kinds of filthy and obnoxious substances. By night they were frequented by evil-doers, to whom they offered a convenient place of retirement and concealment, and altogether it continued a menace to the law-abiding people inhabiting its environs. The estimated cost of the project was 63,000*l.*, of which 30,000*l.* would be for the acquirement of property, and 33,000*l.* for the works. The scheme was intended to give accommodation to 128 families.

PROPOSED AERIAL CABLEWAY.

THE Devil's Dyke, near Brighton, is, *Engineering* says, a steep and narrow gorge running some miles inland, and across which at present there is no other means of communication than by descending the cliffs on the one side and going up them again on the other. A company has recently been formed to supply a much wanted means of communication across this chasm. An ordinary bridge is out of the question, the span required being 650 feet, and the cost, therefore, would be out of proportion to the traffic expected. The plan to be adopted is a modified telfer system, the invention of Mr. W. J. Brewer, C.E. The main feature of this system is the fact that the car to carry the passengers or goods runs on two parallel cables, which are supported at 25 feet intervals from a main suspension cable. The car cables are under considerable tension, and, being supported at such short intervals, sag but little. Each car can carry a load of 4½ tons, and they may be run in trains of as many as twenty-four cars. At the Devil's Dyke cable haulage is to be used, but in future applications of the principle electric traction is contemplated. The towers supporting the main suspension cables have openings in them through which the cars can pass, so that any length of line can be traversed, the system not being confined to the working of a single span. Curves and switches have also been devised, and, in short, the company are prepared to undertake the erection of a regular railway on the system, complete with switches, sidings, and all the usual appurtenances of such.

BUILDING IN JOHANNESBURG.

THE following excited letter has appeared in the *Johannesburg Star*: In your issue of Dec. 22 appears a letter from Mr. Lennox Canning in which reference is made to the work at Green's Chambers. We regret that Mr. Canning, in defence of the bad workmanship in his buildings adjoining Green's Chambers, has felt compelled to make misleading statements, and we would esteem it a favour if you would kindly grant us space in your valuable paper to reply to them. We may state that Mr. Canning was appointed, in London, architect to the Johannesburg Office and Safe Deposit Company, but they afterwards considered their interests would be better served by dispensing with his services. We also take this opportunity of stating that Mr. Canning's plans are not being carried out by us, nor did we see Mr. Canning's plans until ours were completed. As Mr. Canning has made reference to the suit of the Johannesburg Board of Directors v. Victoria Buildings—an action still undecided—we may state that the only parallel consists in conscientious work being carried on at the side of a dangerous structure.

We quite endorse Mr. Canning's sentiments with respect to extended powers being given to our building inspector, especially with regard to the depths and nature of foundations. Then there would be no necessity for shoring up such ruins as exist in Johannesburg until a sound building is erected to support them. It is more to be regretted that a building inspector was not appointed, acting under London building laws, when such buildings as the Barnato Buildings, Robinson's Buildings, the old portion of the Exchange, and many other of Mr. Canning's buildings, were in course of erection. As particular reference has been made by Mr. Canning to these buildings, a few particulars with regard to their foundations may be of interest. The Barnato Buildings foundations are composed for the greater part of loose rubble work, laid dry without mortar on soil, and as from 4 to 5 inches of these foundations projected on to our ground, the owners of the buildings were under the necessity of cutting away the projections and filling in the holes in the wall with lime mortar. Whilst this work was being carried out, some of these stones were so loosely built as to fall out into the side trench. On the Robinson's Buildings side, the so-called concrete foundations set in, instead of projecting 4 inches under the 14 inch superincumbent three-storey brick walls. This wall oversails the foundation, some of the stones in the concrete being 5 inches in diameter, and the depth of the

foundation being only 18 inches from the surface. Settlements existed in this wall long before the old Green's Chambers were pulled down, and tie-bolts had been fixed to prevent further settlement. Mr. Canning states that he informed the Board of the Johannesburg Office and Safe Deposit Company in London that he had long experience of the nature of the subsoil of Johannesburg. If he had gone a foot deeper his experience might have been altered so as to suggest to him the advantage of building on a sound foundation, as a gravel bed is reached at that depth reposing on a clay shale, and we are inclined to believe that his advice to the Board could not have been based on the treacherous nature of the soil, as it does not exist deeper than 3 feet from the surface, but on the treacherous nature of the foundations of the buildings erected by him flanking the site of their proposed building. To prove that the ground in this locality is not of the treacherous nature Mr. Canning would have us believe, if foundations are carried down to a proper depth, the attention of the public might be drawn to the basement now being excavated on the site of Messrs. Malcomess's old store, against Natal Buildings, in exactly the same soil and about 70 feet away from Green's Chambers. There the basement has been excavated straight down at the side of a building erected at a time when Mr. Canning excuses his work because he could not obtain good material. This work would be an impossibility against the sides of Barnato or Robinson's Buildings without those buildings falling in. Mr. Canning also states that on his plan the basement was 10 feet away from the adjoining walls. At the Robinson's Buildings side our basement is 10 feet 6 inches away. Mr. Canning may find, if he chooses, old settlement cracks in the Robinson's Buildings elevation to the streets and away from Green's Chambers, and although the colouring of the front has been so prettily done in Mr. Canning's estimation, these cracks can still be seen, as also in Royal Chambers, immediately adjoining, which was also erected by him. Mr. Canning states that his next article will be on the maintenance of buildings. This, we have no doubt, will be anxiously looked forward to by his late clients.—We are, &c.,

December 29.

LAND VALUES.

IN a letter to the *Times* Mr. E. H. Bousfield writes:—Some of us are thankful that there is a House of Lords, but how much more should we be for the London County Council, so great is the solicitude of that body for the "unemployed." Hitherto the Council have chiefly concerned themselves with the two extremes of society, finding work in plenty for the labourer in his fustian and for the peer in his ermine. Henceforth the working man in broadcloth is to be the object of their care. Work for the unemployed!—a beneficent aspiration. Long years have gone by since the palmy days for lawyers and surveyors; how many of them have grown weary in waiting for work? But, the County Council to the rescue! No sooner has "betterment" been rejected by the Lords, without much labour on their part, thus suddenly blighting the brilliant prospects of the combined professions, than hope revives. They are not to be disappointed, though "betterment" goes to the wall. The Council, at their meeting recently, have adopted their committee's report and their vice-chairman's amendment, and have resolved to ask the Government to bring in a Bill, one effect of which will be practically to create a new land tax on the whole metropolitan district, and on the provincial towns and cities throughout the kingdom, the entire areas thereof to be subject to a valuation of the sites, as though no buildings existed. Here indeed is work for the unemployed surveyor. But that is not all. When his ingenuity has put a "fancy value" on every site, it is open to be questioned, and a "Valuation Court" is to be instituted, that the lawyer may have his turn. It really seems too good to be true; the heart palpitates, the mouth waters at the prospect of the spoils. And yet there is more to come; the splendid revenue this new land tax is to produce, estimated at probably a million a year in London alone, is to be the nest-egg for metropolitan improvements. What glorious visions of compensation cases, arbitrations, juries and all the paraphernalia of the law come forth in startling array before the mind of the unemployed professional working man?

But, on its merits, what a noble and self-sacrificing idea this principle of rating ground values is—a new land tax of from 4 to 10 per cent. to be levied for improvements, from which those who are to pay the tax may not necessarily derive any benefit, or even receive from the site as much as the tax will amount to, while already they pay their full quota of Parliamentary and parochial rates and taxes in respect of such land.

"GREEK LINES."

A VOLUME of essays by Mr. Van Brunt, the American architect, has appeared with the title "Greek Lines and Other Architectural Essays." According to the *Kansas City Star*, it reveals an amount of poetry of high sentiment that is somewhat of a surprise; it is a quality not heretofore suspected in the work of this successful architect, in spite of the fact that he has made of his profession a worship of beauty.

Most of these are early essays revised, and brought into a sequence. They are not elementary by any means, but they are stimulating, inspiring. Where Mr. Van Brunt treats of something which his unlettered reader does not understand, he implants an ardent desire in that reader to at once amend his ignorance. When the essays involve a reference to something with which the reader is not familiar, he is at once impelled to follow it up, in order to enjoy to the fullest this delightful book.

Mr. Van Brunt thus traces the source of art and the real source of the appreciation of it, art criticism:—

"The human heart, in its best estate, for ever yearns to create, to give in some form expression and life to those evasive ideals of loveliness which are planted within our consciousness by the aspects of nature. It is impossible for a true work of art to exist unless this great creative principle of love is present in its inception, in its execution, in its detail. It must be pervaded with the warmth of human, passionate affection. The skill which we are so apt to worship is but the instrument in the hands of love. It is the means by which this humanity is transferred to the work, and there idealised in the forms of nature. The test of art is in our own hearts. It is not to the dogmas of critics, the artificial rules of æsthetics, that we wisely resort for judgment concerning works of art. Though our opinions may be warped, there are depths of immortal truth within us, which, when dimly revealed in some rare moment of insight, seem to show that we possess a standard and a criterion far nobler than the schools can give us."

Such is Mr. Van Brunt's theory, and supremely interesting is the reasoning on which he builds it up; the essay becomes, in reality, a series of illuminating glimpses into the history, the attainments, of the nations. And this too, Mr. Van Brunt claims, that architecture reveals more of the real life of a people than written history does.

In one place the author writes:—"Art which is systematised

is degraded. What all Roman art wants is the inward life, the living soul, which gives a peculiar expressiveness to every individual work, and raises it infinitely above the dangerous formalism of the schools." These enlightening words apply as clearly to work of the present day.

The chapters on the Greek lines contain a condensed history of architecture down to the present time, and particularly interesting are the pages on the Gothic and on the Renaissance architecture. Another essay reviews "The Present State of Architecture," and in it Mr. Van Brunt holds out high hopes of what American architects are to accomplish.

The essay on "Conscience in Architecture" bears a title not in itself attractive, but it will probably be read oftener, be enjoyed more, be quoted oftener than any other essay in the book. It is a contrast of the attitude of the artist of to-day, as compared with the artist of former ages.

From this beginning the author goes on to the art of the Greeks, which appeals directly to "the sympathetic depth of our souls and the half impalpable ideals there."

Taking up his subject of lines, Mr. Van Brunt continues:—

"Abstract lines are the most concentrated expressions of human ideas. They are the grand hieroglyphic symbolism of the aggregate of human thought. I believe that all true lines of grace and beauty are capable of division into three distinct classes, according to the respective spirit or genius of the three civilisations out of which they grew, and that each class, as it expresses a unity of great significance in the history of the human race, is capable of concentrating its distinguishing characteristics in one representative line, which may stand as the symbol, the gesture, as it were, of an era in this history. The three great distinctive eras of art, in a purely psychological sense, were the Egyptian, the Grecian and the Romanesque. The lines, which are the concentration of three civilisations, represent Destiny, Love and Life—destiny finding utterance in the stern and inflexible simplicity of the tombs and obelisks of Egypt; love expressing itself in the statuesque and thoughtful grace of Grecian temples, statues and urns; life in the sensuous and impulsive change, evident in all the developments of art, since Greece became a province of the Roman empire."

"The artists of antiquity found simplicity and repose in more fidelity to a rigid standard. Their ideal was a divinity; their service to this divinity was worship and obedience. Our ideal is a museum of heterogeneous and beautiful forms, and our service to it is selection, classification. Indeed, the

modern artist is not the servant of his ideal; he properly seeks to be its master. The individual can no longer be lost in his art. A new, subjective, personal element has been born into art. Now the artist says, 'I not only feel, but I understand.'"

Mr. Van Brunt sums up this subject with:—"Our present conditions of life must give to art in all its forms certain distinctive characteristics. These conditions require the establishment of principles and not forms as standards of excellent work. They make forms the language and not the end of art. The very finest result of high culture in architecture as in literature is to utter thought with simplicity."

"The Personal Equation," the next essay, takes up and elaborates the historical architecture touched on in the finishing chapter of the essay on Greek lines. Here again the Gothic and the Renaissance architectures, the spirits of those ages, are clearly and charmingly presented.

In "The Royal Château of Blois," Mr. Van Brunt illustrates his theory of the great value of architectural evidence in the history of a nation's life. This essay makes it a temptation to say that it is even more interesting than the other essay just designated as the most interesting in the book. Blois is in itself so full of romance, so crowded with history, that when Mr. Van Brunt's clear explanations open one's eyes to so much beauty in it, its spell grows powerful.

"Architecture and Poetry" really holds less of the spirit of poetry in it than does the "Greek Lines," the opening essay, which is like a hymn to beauty. In "Architecture and Poetry" Mr. Van Brunt discusses the different things the poets have said in describing architecture, quoting Lowell, Wordsworth, Dante and half-a-dozen others, and at the end he offers a poem which expresses what the architect with his greater vision sees in a church door. Thus begins the poem:—

Twice four hundred years have borne
To this doorway, gray and worn,
Weary weights of grief and sin;
Contrite have they entered in,
And, beneath the arch of stone,
Laid their burdens down, and known
That to faith, whate'er betide,
The doors of heaven are opened wide.
For with invitation sweet,
The pastoral church, her flock to greet,
To fold, to comfort, and to feed,
This Portal Beautiful decreed.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

GLASGOW CATHEDRAL.

THE ELECTRICAL TRADE AND THE ANTWERP EXHIBITION.

A MEETING of the electrical trade section of the London Chamber of Commerce has been held at St. Botolph House, Eastcheap, to consider the advisability of the industry as a whole lending its support to the Antwerp International Exhibition which opens in May next. Mr. E. Garcke, who presided, said he had approached a number of electrical manufacturing firms on the subject, but they did not show much disposition to do anything. Personally he did not think the Antwerp Exhibition would appeal to the trade generally, especially so far as the manufacturers of dynamos and other articles of the kind were concerned. As a matter of fact the Continent was very largely closed against English firms who manufactured electrical apparatus, owing to the duties, which were very heavy in Germany, France and Austria. In the course of some discussion it was stated that by exhibiting their goods at Antwerp English firms would be doing themselves little if any good, whereas they would give their competitors the opportunity of learning a great deal from them. On the other hand, it was recognised that English people were not likely to improve our trade by abstaining from such exhibitions, although it was felt to be very hard that the charges for duties should be thrown upon individual firms. It was eventually decided, at the suggestion of the Chairman, that a circular should be issued to the trade bringing to their notice the opportunity of obtaining space at special terms by applying to the London Chamber of Commerce.

By a majority of 797 the ratepayers of Bangor have authorised the Town Council to apply for a loan of 25,000*l.* for the creation of a pier, and the purchase of the ferry rights across the Menai Straits.

OETZMANN'S PATENT WRITING TABLE.

BUILDERS' CLAIM.

At the adjourned holding of the Flintshire Assizes, held at Chester Castle, Mr. Justice Bruce heard an action brought by Messrs. E. Thorpe & Sons, builders, Llandudno, against Mr. George Smith, Llandudno, to recover 105*l.*, balance of amount alleged to be due to plaintiffs for work done in respect of defendant's premises at Llandudno. Mr. E. Honoratus Lloyd appeared for the plaintiff and Mr. Bryn Roberts, M.P., and Mr. Colt Williams represented the defendant. It appeared that in September 1892 defendant engaged plaintiffs to erect a new porch at his residence, and subsequent to this, other work was also carried out on defendant's premises by plaintiffs. Evidence was given by two architects to show that the amount charged for the work was reasonable. Defendant disputed the claim on the ground that plaintiffs entered into a contract to carry out the work for 200*l.*, and it was further submitted that the work had not been satisfactorily done, and that defendant had supplied certain materials. His lordship in reviewing the evidence said he could not come to any other conclusion on the evidence than that the prices charged by plaintiffs were fair. He also considered that the work had been satisfactorily done. He could not see that defendant had established any defence to the action, and it seemed to him that plaintiffs had established their claim with the exception of one item, for which he should deduct 2*l.* 6s. 6d. He should give judgment for plaintiffs for 103*l.* 5s. 8d., with costs.

ELECTRICITY.

At the meeting of the Birmingham Midland Institute, Professor Silvanus P. Thompson, F.R.S., lectured to a large audience upon "The Supply and Measurement of Electricity." He said that ever since the time when electricity became a commodity to be supplied to the public from large central establishments, it had become a matter of general interest to the consumer to know something of the mode in which he was supplied, and of the way in which the commodity was measured. He directed attention to a series of diagrams showing, from the experience of several electric supply stations, the manner in which consumption varies, according to the period of the year and according to the day. He then described some of the methods of laying out circuits, and exhibited a variety of illustrations of generating stations. In this connection he compared favour-

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

ably the arrangement of powerful but compact engines in direct connection with large dynamos which were to be seen in English generating stations, and among them the one in Birmingham, with the fussy array of small dynamos, driven through the intervention of elaborate shafting and belting, which had found favour with American engineers. Nothing was more strange, he said, to an American than the high-speed direct Willans engine and solid-looking dynamo exhibited from this country at Chicago last year. The system of converting high-pressure currents which could be conveyed long distances by small conductors into low-pressure currents, such as were safe to introduce into buildings and requiring large conductors, was next described, and then explanations were given of the meters which had been devised for measuring the current, from the early meters of Edison and of Spragg, of Birmingham, in which it was gauged by the amount of copper or zinc-electro deposited in a bottle, to clockwork meters, in which the retardation of a pendulum by the current was the principal factor, to several forms of electro-motor meters. A special word of commendation was given to Mr. G. Hookham, of Birmingham, for the share he had taken in connection with the solution of electric-meter problems. The general effect of his discourse, which, notwithstanding the technical nature of the subject, secured general attention, was to show how rapid had been the stride made in the twelve years since electricity began to be supplied in 1881, alike in the appliances for generating and distributing the electric current and in the various accessories for the benefit and safety of the consumer.

WATER DAM IN CALIFORNIA.

THE completion of the Turlock and Modesto irrigation dam gives California, the *Pacific Lumberman* says, the largest and highest overflow dam in the world. The contract for the great structure was let in June, 1891, and although two years and a half have elapsed, the preliminaries and the months lost by reason of high water reduce the actual working time to fourteen months, during which period 150 men—all white—were employed. It will be readily appreciated that the preliminary work, including the diverting of the waters of the Tuolumne river by means of flumes, and the excavation to bedrock for the base, was a task of no small magnitude. Added to this was the necessity for lowering the machinery employed, including nine donkey and stationary engines, from the summit of a hill

towering above the scene of operations on the hillside and in the river bed. All the supplies, too, were handled in this manner.

The dam, it should be premised, is situated on the Tuolumne river, where that stream foams through a canyon in the foothills of the Sierra Nevada range of mountains, a mile and three-quarters above the old mining town of La Grange and about thirty-three miles east of Modesto. The ragged, mountainous hills that tower on either side are of blue trap formation, covered by a scanty soil, and at the site of the dam the conformation is such that the masonry laid by the builders interlocks with and is supported by the hillsides. The original plans of the dam were approved by Colonel Mendell, the noted civil engineer, and have been followed without material change. It is constructed on the principle of an arch, on a radius of 300 feet; hence its surface length on the top is 336 feet, while a straight line drawn from bank to bank would be but 317 feet in length. Its base is 70 feet in length and 97 feet through, sloping upward on the lower side at a ratio of 4.67 feet in 10 feet, so that at a height 11 feet from the top, from which point it is rounded to carry the overflow water down the slope, its breadth diminishes to 24 feet. The upper wall is perpendicular, and both upper and lower walls are of shaped rock laid in cement mortar.

Embraced in this stupendous structure are approximately 40,000 cubic yards of rubble masonry. Over 31,000 barrels of cement, each weighing 400 lbs., entered into its construction. The centre of the dam, between the face walls, is comprised of great masses of blue trap embedded in concrete, the interstices filled with smaller rock and concrete, and the whole thoroughly rammed. The rock is the blue trap of the country blasted from quarries opened near the spot, drawn up an inclined railway and conveyed to the spot required by a system of elevated cable tramways. The concrete used is composed of a mixture of 22 cubic feet of broken rock, 8 cubic feet of sand and one barrel of cement, washed and mixed in a revolving mixer operated by steam and conveyed to the dam by the cable tramways.

Two sand-ways are provided for in the dam, but the water not taken out by the canals is to go over the top and down the inclined lower wall to the bed of the stream, impinging first on the "leg" of the structure, which, of rubble masonry, extends out some distance and obviates all possibility of undermining.

A great reservoir is formed by the dam, the water of the river backing up for three miles. This winter and next spring, at times of freshets, a volume of water ranging from 5 to 20 feet

in depth will pour over the structure. The cost to the districts of this most essential factor in the irrigation enterprise ranges from 525,000 dols. to 550,000 dols. equally divided. The main canals designed to carry the water to the irrigation districts are well advanced, and have a carrying capacity estimated to be sufficient to give an average of 1 foot of water for every quarter-section embraced in the 257,000 acres comprising the two districts. While the advantages to accrue from the use of the water in this direction overshadow all others, the fact that there exist great possibilities for the generation of power to be transmitted through the medium of electricity has not been lost sight of.

NECESSARY WORKS IN STREETS.

ON Tuesday judgment was given in the Court of Appeal by the Lords Justices in *Stroud v. the Wandsworth District Board of Works*. This was an appeal, says the *Times*, against the decision of a Divisional Court (Mr. Justice Charles and Mr. Justice Wright) reported in the *Times* of November 11 last, and in the *Times* Law Reports, vol. 10, p. 50. The case raised an important question under the Metropolis Management Act of 1890 (53 and 54 Vict., c. 66, s. 3) and similar statutes, as to the power of local boards to order "necessary works" to be done at the expense of owners of property—whether this means actually necessary in the view of the magistrate or necessary in the view of the board. The appellant, Mr. Stroud, is the owner of a house and land within the Wandsworth district abutting on a road which had been used for more than six months for public traffic, and had not become repairable by the board. On March 27, 1892, the board resolved to execute some repairs on the road under the powers given to them by the Act, the repairs being deemed by them to be necessary. The works were done in pursuance of the resolution, and the expenses were apportioned among the adjoining owners. Section 3 enacts that "any vestry or district board may from time to time execute any necessary works of repair upon any or any part of any carriage road within their parish or district which shall have been used for not less than six months for public traffic, and which may not at the time of such repair have become repairable by them, and shall not by undertaking such repair prejudice or affect the powers of such vestry or district board to apportion and recover the expenses of paving such road or way if and when the same shall be paved as a new street under the Metropolis Management Acts"; and then

it is provided that the expenses of such repair may, in the first instance, be paid by the local authority in the same manner as the expenses of repairing other streets repairable by them, and afterwards be apportioned and recovered from the owners of adjoining lands in the same manner as expenses of paving such road as a new street. On the hearing of a summons claiming from Mr. Stroud the sum of 26*l.*, the amount of his share of the apportionment, he proposed to contest the necessity of the repairs; but the magistrate was of opinion that it was not for him to decide whether the repairs were necessary or not, but that he was bound by the decision of the board on the point, and he accordingly ordered Mr. Stroud to pay the amount. He appealed to the Divisional Court, and the learned judges, with some hesitation, especially on the part of Mr. Justice Wright, held that the board, provided that they acted *bona fide* (and there was no allegation of want of *bona fides* in the present case), were the sole judges of the "necessity" of the work. The decision of the magistrate was, therefore, affirmed, but leave to appeal was given. Mr. Stroud appealed.

The Court dismissed the appeal.

Lord Justice Lindley said that the case raised a question of some little difficulty, viz. Who was to be the judge of the necessity of the repairs executed by the Board under section 3 of the Act of 1890? His lordship thought that the solution of the difficulty was to be found in considering the object of the section. It was in substance an addition to a group of sections in the Metropolis Management Acts of 1855 and 1862 relating to the paving of streets. The local authorities had by those sections power to pave "streets," but they had no similar power with reference to roads which had not yet become "streets." Under the old Acts it was clear—indeed it was said so in express words—that the local authority was to be the judge of the necessity or propriety of the work. In his lordship's opinion the true construction of section 3 was that the same persons were to be the judges of the necessity of the repairs executed under that section. He did not think that Parliament intended that two different tribunals should be judges of similar necessities. It was urged that by the change in language Parliament had shown that this was their intention, and reference was made to another Act (cap. 54, section 1) passed on the very same day in the same year, 1890, which dealt with similar matters, and in which the words used were "which shall have been deemed by the board necessary or expedient." The history of this difference was that cap. 54, section 1, was a repeal of former provisions and a re-enactment of them with an

THE "WASH-OUT" CLOSET

(PATENT).

THREE AWARDS AT THE INTERNATIONAL MEDICAL SANITARY EXHIBITION, SOUTH KENSINGTON, 1881.

WASH-OUT.

"How to Drain a House," from a paper by T. MELLARD READE, Esq., C.E., F.R.I.B.A., read before the Liverpool Architectural Society:—"I consider the pan-closet objectionable, especially since the introduction of the two-gallon regulating cistern has increased the difficulty of getting the after-flush to fill the pan. The 'container' is usually a reservoir coated with filth, hidden by the pan holding the water in the basin. A basin with a trap at the side or back, called a 'WASH-OUT' basin, is a far better apparatus."

"Improvement on Sanitary Condition of Houses," from a paper by J. CORBETT, Esq., read before the Social Science Congress, Manchester, 1879: "We replace defective Closet Appliances by the simple 'WASH-OUT CLOSET,' which is of white earthenware, without any valve, and so perfectly self-cleansing as to require very little attention."

Extract from a letter by "M. O. H.," a Medical Officer of Health, *Daily Telegraph*, September 22, 1880: "The Local Government Board forbids the use of these pan-closets. . . . They may be easily replaced by one of the 'WASH-OUT' CLOSET Basins."

Extract from a lecture by W. RASSIE, Esq., C.E., at the International Health Exhibition, May 28, 1884: "A cleanly 'WASH-OUT' Flushing Rim Basin in connection with a small Flushing Tank overhead which merely required a touch of the depending chain and ring to liberate the whole contents."

addition, whereas section 3 of cap. 66 was an entirely new one. It was said that the view of the Divisional Court was inconsistent with the decision of this Court in *The Queen v. Marsham* (1892, 1 Q.B. 371). His lordship did not think it was. In that case the Court held that the local authority were not the judges of what were "paving expenses," though they were judges of the propriety of the expenditure, if they could show that it was incurred for paving. It was quite consistent with that decision that the board under section 3 were not judges of what were repairs, though they were the sole judges of the necessity of the repairs. If the Court were to decide differently they would be putting on these Acts a construction which would lead to the wildest confusion.

Lord Justice Kay, in the course of a judgment to the same effect, said he thought the effect of the decision in the *Queen v. Marsham* was that, in order to recover an apportioned part of alleged "paving expenses" from an adjoining landowner, the local authority must show that the work had been done, and that the alleged expenses were expenses of paving, but that they were not bound to show that the expenses were proper. It was for the local board to decide as to the propriety of the expenses. That applied to the present case. The board must show that the repairs had been executed, and that the expenses were expenses of repairing, and then the decision in the *Queen v. Marsham* was satisfied. It did not follow that the "necessity" of the repairs was a matter for the decision of a magistrate. *Prima facie* a public authority, such as a district board, must have some discretion vested in them, and his lordship thought the word "necessary," though not accompanied by the words "which they may think" or "as they shall deem," might be fairly construed as meaning "necessary" in the opinion of the board who had power to do the work and to apportion the expense.

Lord Justice Smith concurred.

THE LONDON COUNTY COUNCIL COTTAGES.

THE London County Council, says the *Daily News*, are rapidly progressing with their new cottage building at East Greenwich, and in a few weeks the first block of these dwellings will be ready for occupation. These will be their first erections of the kind, and a great amount of interest naturally attaches to them. There is, indeed, some danger that an undue degree of importance will be accorded to the outcome of this first experiment

in municipal cottage building by London's great executive. It is very likely that any little structural imperfections or financial shortcomings may be seized upon by the critics of the Council to illustrate the impossibility of this sort of thing being successfully carried out by a public body. There is one respect in which this first enterprise has certainly been a little unfortunate. House-building in this district of London has been forced upon the Council in consequence of their having had to sweep away a good many working-class dwellings for the Blackwall Tunnel works. They were required by Act of Parliament to put up others within a mile of the site of the demolished dwellings. Their operations were thus confined to a radius within which practically all the land is of the nature of a bog. It is, in fact, a part of the Greenwich marshes, all of which consist more or less of a spongy sort of peat. To get at a satisfactory foundation, excavations would have to be carried down to a depth of 13 or 14 feet, and this could not be done without a very expensive use of pumps to keep down the water with which the whole marsh is saturated. Of course this would have added enormously to the cost of the cottages, and would have precluded all possibility of getting a paying rent for them. After much anxious consideration, therefore, it was resolved by the Housing of the Working Classes Committee to make the best of what was felt to be an unsatisfactory site, and instead of excavating down to the solid bottom, to lay down platforms of concrete for the five blocks of cottages designed. The soil was removed to the depth of 3 feet and concrete poured in, so as to form a solid bed, hard as rock, and covering the entire site of each block, with a margin of 3 feet beyond the building all round. Whether eventually the result will prove as satisfactory as could be desired time only can show. Any part of a marsh is liable to be affected by drainage or excavations in any other part, and the subsidence of the concrete foundations may at any time prove troublesome. One of the blocks has already settled down irregularly to an extent which, if the houses upon it were of the jerry-built order, would seriously imperil their stability. They are, however, of first-class workmanship, and the subsidence cannot affect them, and it is believed that no further settlement of any importance is probable.

It is a pity that the first venture of this kind should not have had a more propitious starting-point, for the cottages as designed in the office of Mr. Blashill, F.R.I.B.A., the architect to the Council, and built by the Works Department, are in almost every respect most admirable. They are intended for a

ARCHITECTURAL IRONWORK. TO ARCHITECTS.

DEAR SIRS.—We have pleasure in informing you that we have purchased the important stock of models, including ornamental Columns, Brackets, Panels, &c., from the Prince of Wales Foundry, Shipley, until recently carried on by the late Mr. Robert Hird. We have appointed Mr. Gore Hird Manager of our Foundry Department, and his long and varied experience will insure any work entrusted to us being well and carefully carried out.

In architectural and structural ironwork Mr. Hird is specially skilled, and we ask as a favour that you will give us the opportunity of tendering for any work you may have in hand.

Yours faithfully, SAMUEL DENISON & SON, VULCAN FOUNDRY, LEEDS.

population of just under 500. There are, or there will be when they are all finished, altogether 78 tenements, comprising 232 rooms, the occupants of which the Council will endeavour to restrict to an average of two persons to a room in each tenement. The full complement therefore should be 464. The houses are built in five rows, with plenty of space between them. They are all designed on the wholesome principle of making each tenement a complete and separate home, and though of course these homes are very small, they are planned with the most careful ingenuity for the comfort and convenience of the tenants. Ten of the cottages are double, with one tenement on the ground floor and one above. The floors above are sound-proof and fire-proof, and—what is an extremely important matter in property of this class—every part of the house has been designed with a view to make them “vermin proof.” As far as possible the use of wood has been avoided in their construction. The skirting round the walls is not boarding but the hardest of cement, and the walls themselves are of impenetrable hardness. The inner partition walls are constructed on what is technically known as the Cunnah-Wright principle, a combination of thin iron plates and cement specially designed to afford great strength and solidity with very small bulk. Where every inch of space is valuable those qualities are of course very important. As partitions they are in many respects as efficient as the best of brick walls, while occupying far less room. There are thirty tenements of two rooms, which may possibly be occupied by a family of four persons; twenty tenements of three rooms, for a family of six; and twenty-eight tenements of four rooms, each of which may be occupied by eight persons. Each of these dwellings has one room designed for a sitting-room. It has a fireplace of the severest simplicity of plan, the only ornamentation being a surrounding of reddish-brown glazed bricks, with a mantelpiece above. This will be found absolutely impervious to all attempts to damage or misuse, while beneath the chimney is a small and very efficient kitchen range, known as the “Cundy.” It is a closed or open fireplace with a good hot-water boiler and an oven underneath the fire. At the back of each double cottage tenement is a sink with water tap and a closet so arranged that the door is virtually in the open air, being at the side of a small railed balcony. There is gas on the staircases, but no provision has been made for it within the rooms. The single cottages, of which there are twenty-eight, are really very complete and comfortable little houses, on a somewhat Lilliputian scale. Each has a frontage of only about 12 feet 3 inches, but they are exceedingly well planned, and though so small have an aspect of

lightness and airiness delightfully contrasting with many of the dark and stuffy dens in which so many people are doomed to lose health and spirits.

These new “West View Cottages,” as they are to be called, are not absolutely faultless. The necessity of confining the rents of them to about the tune of the rents around them, while making them pay a satisfactory interest on outlay, has forbidden some arrangements that Mr. Blashill and his very able and devoted chief assistant, Mr. Owen Fleming, A.R.I.B.A., would gladly have embodied, while it has necessitated some features that are hardly satisfactory. For instance, the severe economising of space has led to the fixing of cupboards under the windows of the sitting-rooms, and as a consequence of this arrangement the windows are somewhat too high to make the rooms as pleasant as they might be. Then, again, a small coal-cellar, outside each tenement, would have been very desirable. Considerations of space and cost forbade this, and the only receptacle for coal is a wooden bunk in the sitting-room, except in the separate cottages, each of which has a convenient coal-cellar as well as a good scullery. There is one defect in all the sitting-rooms that surely might have been obviated. The tenants will have no means whatever of fixing up a picture on their walls. They are splendid wall surfaces, smooth and hard as marble almost, and, even if practicable to drive nails into them, the regulations will have to forbid it. But surely a picture-rod might have been run along the top of the walls or a strip of wood embedded in the cement. It is very desirable to encourage the embellishment of the home when people are disposed to do it, and, though this may seem a trifle, it is an important trifle.

But when all is said, these new cottages of the London County Council are most admirable. Externally, as internally, they are as plain as plain can be. They are of brick, with red tiles, and not a bit of ornamentation about them in any shape or form. But they are picturesque in their simplicity. Some of their walls as well as their steep-pitched roofs are covered with red tiles in the old-fashioned way one may often see embodied in country cottages. There is none of the dreary repulsive ugliness so horribly characteristic of hundreds of miles of streets in London. The houses look cosy and homelike, and in their warm colouring and bold originality of design present a very striking contrast with the mean and squalid house property in the immediate vicinity, comparatively new though much of that is.

ATMOSPHERIC IMPURITIES.

A LECTURE has been given by Dr. Garey on "Atmospheric Impurities" in the Burgh Court-room, Govanhill. In introducing his subject, the lecturer said there were three divisions which might be taken up in considering the large question of public health—(1) the air-supply, (2) the water-supply, and (3) the drainage, which last, however, was intimately associated with both the others. He had chosen to speak of the air supply as being perhaps the most interesting and instructive. In the improvements which had been effected during the last thirty years, science had taught men much that had been invaluable, and during that period the death-rate from preventable diseases, especially in large centres of population, had been reduced to the extent of 25 per cent. and more. In other words, where four had died from preventable diseases, only three now died. A curious calculation made from that fact was that, taking the earning power of each individual as at 20s. per week—which, capitalised at 5 per cent., would give them 1,000l.—they had the enormous increase of about 3,000,000l. capital in Scotland by the saving effected. Every householder should have a clear idea of what entered into the composition of air, its uses and the different ways in which it was rendered impure. This was the more necessary that its impurities were often so impalpable. Water or food readily showed impurity, but some of the most deadly poisons in air were invisible, and were not even to be detected by the sense of smell. Dealing first with the quantity of air required, the lecturer explained how the quantity increased from infancy to middle age, and as years advanced again decreased, and in a popular way he stated the enormous figures involved in the consumption of air by individuals and by communities. He then explained the constituents of pure air, and by experiments showed the different effect of the gases which go to make up our atmosphere; by that means he portrayed their action when breathed into a living body, and the beautiful and complex arrangement by which the waste was collected and thrown out in the form of carbonic acid gas, whose properties and dangerous qualities he explained by simple and convincing experiments. From those he demonstrated that 180,000 tons of waste were thus expended in Glasgow alone. The question then arose, What were they to do? They had the diagnosis. What was the cure? Medical science was largely preventative,

and in that direction they must look. The best and most effective preventative was ventilation, and he strongly condemned the crowding of people together in low-lying districts, and the close confinement resulting from building in squares. One of the simplest and best methods of ventilation was to raise the lower sash of a window, placing a board underneath so as to cause the air to enter in the middle of a room, and in the ordinary kitchen fire they had the necessary means of producing a current. Other causes of impurity were lightly touched upon, as time did not permit of fuller explanation.

NORTH BRIDGE, EDINBURGH.

At a meeting of a sub-committee of the Lord Provost's Committee of the Edinburgh Town Council, new plans were submitted on behalf of the North British Railway Company for the reconstruction of the North Bridge. Mr. Hall Blyth, C.E., attended the meeting in the interests of the railway company, and Sir William Arrol and Mr. Hunter, the law agent of the city, were present to advise the Corporation. The plans submitted showed an ornate design for a hotel at the south-east end of Princes Street, extending backwards to the new buildings, as far as the Tramway Company's offices, and clearing away the premises of Messrs. Cranston & Elliot and the adjoining buildings on the North Bridge. The proposed new bridge covers the railway area in two spans, with a third and shorter span carrying it over Jeffrey Street, while the railway lines between the North Bridge and the Waverley Bridge are covered with glass. It transpired that while the railway company were still willing to contribute 30,000l. towards the construction of the bridge, Sir William Arrol estimated the total cost of the undertaking at 90,000l. It was suggested that although the railway company did not seem willing to pay a sum based on the proportional cost of the bridge, it might be arranged that the company should undertake the building of the bridge, and that the city should limit their contribution to 60,000l. The question of widening the North Bridge was afterwards considered, along with estimates of the cost by Messrs. Cousin & Ormiston, architects, and Mr. Laing, city assessor. The following sub-committee was appointed to consider the whole question:—The Lord Provost, Bailies Dunlop, M'Donald and Steel, Dean of Guild Miller and Mr. Colston.

SPRINKLER, Closed.

THE GRINNELL AUTOMATIC SPRINKLER

And the Great Fire in Old Bailey.

LETTER FROM "THE TIMES."

"CASSELL & COMPANY (Limited) write to us, under date November 16, as follows:—'Will you kindly allow us to state that the fire which took place in Fleet Lane last night, and by which a portion of our premises was damaged, will not in any way interfere with the punctual issue of our magazines, periodicals and books? All our monthly magazines for December will be issued at the usual date, and our weekly periodicals, *Cassell's Saturday Journal*, *Chums*, and *Cottage Gardening*, at the ordinary time next week. This week's issue of *Work* and of the *Speaker* may be an hour or two late; but full editions have been prepared, and will be obtainable in the ordinary course. We should like to add, for the information of your readers in general, and of those interested in insurance matters in particular, that the system known as GRINNELL'S AUTOMATIC SPRINKLERS, which we adopted some years ago as a protection against fire, acted admirably on this the first occasion on which it has been practically tested, and undoubtedly did much to save our buildings from serious damage by fire.'

BAILEY'S LANE BOARD SCHOOL.

THE London School Board on December 7 adopted a resolution, which was moved by Mr. Lyulph Stanley, against the recommendation of the school accommodation and attendance committee, to the effect that a letter be addressed to the Education Department stating that the Board would comply with their lordships' request to at once build upon the Bailey's Lane site, Hackney, a school for 400 children, which, as the numbers grew, might form the infants' department of a larger school. The committee had recommended that the Department should be informed that the Board proposed to continue the temporary buildings on the site for a further period in order to see how the district would develop. At a subsequent meeting of the Board, Mr. Stanley's resolution was rescinded, and the committee's proposal adopted, permission being asked to withdraw the previous letter on the subject. The Education Department have now addressed a letter to the Board in which they state that their lordships regarded the letter of December 8, which announced that the Board had decided to build at once upon the Bailey's Lane site a school for 400 children, as the settlement of the long correspondence which had taken place upon this subject, and as meeting the immediate requirements of the district, while reserving to the Board the opportunity of waiting to see how the district should develop before being committed as to the size of the larger school. Their lordships say that they are unable to consent to the withdrawal of the letter, and remind the Board that it is the statutory duty of the Board to provide school accommodation for the children who are resident in Hackney in the neighbourhood of this site, and that they are of opinion that any further postponement of the performance of this duty would be inconsistent with the terms of the undertaking given in the Board's letter of November 1, 1892, in which it was stated that "the question whether it will be necessary to build the permanent school for more than 300 is now under consideration, and so soon as it shall have been settled the school will be planned and tenders obtained for its erection." Their lordships point out that the Bailey's Lane School has been projected since 1887, and that the Board has been in possession of the land since 1890, while the necessity of the school has been proved by the fact that the temporary iron buildings are unable to accommodate all the children who required admission. After stating that it appears to be clear that the school is required for the

Hackney children, they call attention to the fact that, in this case, not only have the Board received repeated reminders from the Department of the necessity of proceeding with the Bailey's Lane School, but that on August 17, 1893, notice was sent to the Board that no further grants would be paid to the school in its temporary premises unless their lordships were satisfied that the Board were proceeding with due despatch to provide permanent buildings. They request the Board to take the matter into consideration at their early convenience.

INSTITUTION OF CIVIL ENGINEERS.

At the meeting of this Institution last week Mr. Alfred Giles, president, in the chair, a paper entitled "Tunnels on the Dore and Chinley Railway," by the late Mr. Percy Rickard, M. Inst. C.E., was read.

In 1888 the Midland Railway Company acquired powers which had been granted to an independent company for the construction of a line between Dore and Chinley over nearly the same route as a railway projected about sixty years before. The works were of an exceptionally heavy character and included the Totley Tunnel, $3\frac{1}{2}$ miles long, and the Cowburn Tunnel, over 2 miles long, which formed the subject of the paper. There was also a short tunnel of 90 yards, presenting unusual features.

Dealing first with the Totley Tunnel, the author described the measures taken to secure the accurate setting-out of the centre line. The line having been fixed with as much precision as could be obtained with a 6-inch theodolite, observatories were built at the extreme stations and at each end of the changes of the ground-surface over the tunnel; two other observatories were also placed outside the tunnel beyond the western (Padley) entrance. These structures were built hollow, of brick in cement, and capped with stone, the ground-section being that of a cross with double arms. A transit-instrument of the fixed type, with a 3-inch object glass, was used for the observations. The arrangements for taking the sights were described in detail. Great inconvenience was experienced at the outset in finding favourable weather for fixing the line upon the terminal stations. The only times when the weather answered the necessary requirements were rare occasions in the spring and autumn, between the abatement of a high wind and a fall of rain; and as these could not be predicted and a day's preparation was necessary much time was wasted. WORKS, ROTHERHAM. Estab. 1854.

greatest difficulty was found in sighting across the Derwent Valley westwards. After the centre-line had been fixed upon the observatories at the surface, the positions of the four shafts at Totley were set out from them; and when the shafts had been sunk the centre-line for the headings was transferred below in the ordinary way by weighted wires suspended from the top—the lines being produced underground until the headings met between the shafts.

The constructive works were next referred to. The size of the heading throughout was 10 feet by 9 feet, clear of timber—large enough to take a fully-loaded waggon—and it was driven at the formation-level or thereabouts. A commencement was made at Padley on September 27, 1888, the first 530 yards being driven by hand-power only. Great and continual difficulty was encountered at both headings from the influx of water. Up to September 1889 all the water was got rid of by lifting at shaft A; the volume amounted to 2,250,000 gallons a day. Subsequently elaborate drainage-arrangements had to be employed. In November 1891, when the Padley heading had advanced to 1,880 yards, a natural reservoir was tapped, and the water, rushing down the heading, was impounded where the level dipped, and eventually cut off all access to the face. The volume discharged by the shoot was ascertained to be 5,000 gallons per minute. Driving was resumed on February 26, 1892. With regard to the hindrances caused by the unexpected amount of water tapped at Padley, the author remarked that the best means of drainage during construction was a spacious grip in the centre of the heading, covered with timber and therefore easily accessible; that the heading should not be carried below the formation unless the tunnel were inverted; and that the drainage of the foundation of the lengths of lining was best obtained, in cases where there was much water, by the employment of compressed-air pumps.

The whole of the headings, with the exception of 880 yards at Totley and 530 yards at Padley, were driven by means of compressed-air drills. Compressed air was also mainly used for ventilation. The plant, consisting of Schram and Larmuth rock-drills and Fowler air-compressors, was fully described. Gelignite was the only explosive used, and as the progress of the headings was of so much importance, no limit was set to the quantity that might be used by the miners. This was excessive, the holes being generally one-half or two-thirds filled. The total amount used in the tunnel was 163 tons. Until the headings met the ventilation beyond No. 4 shaft from Totley depended entirely upon air supplied by the compressors. In

addition to the exhaust from the machines, 2-inch ventilating pipes discharged air from the main in each break-up. Each of the 18-inch Schram compressors discharged 450 cubic feet per minute, whilst the 4-foot compressor, subsequently employed to replace one of these, discharged 2,000 cubic feet per minute. The smallest allowance per man, between April 1891 and January 1892, was under 300 cubic feet per hour. At Padley the ventilation was generally good, the large quantity of water streaming from the roof dissolving the exhaled carbonic acid and other soluble gases. The progress of this heading was, however, frequently stopped by the discharge of impure air into the workings during certain periods synchronising with every fall of the barometer.

The tunnel was lined with brickwork throughout except for 1,940 yards from the Padley entrance, where the side walls were of block-in-course masonry. The mortar was of lias lime where the ground was dry and of Portland cement where there was water. The thickness of the masonry side-walls through rock which was much jointed was 1 foot 9 inches, through shale, 2 feet; and in heavy ground, 2 feet 3 inches. The brickwork side-walls were of the same thickness as the arch, namely, 1 foot 6 inches through rock, 1 foot 10½ inches through shale, and 2 feet 3 inches in heavy ground. There were 434 yards of invert near the Totley entrance and 356 yards at the Padley entrance, the invert being of brickwork 1 foot 6 inches in thickness. Old English bond was used throughout. For the convenience of the platelayers small manholes were built at every chain on alternate sides of the tunnel and large manholes, 10 feet each way, at every half-mile. A 2-feet 9-inch culvert of brickwork in cement was built under the 6-feet way and extended 2,112 yards from the Totley entrance and 1,920 yards from the Padley entrance. An 18-inch glazed and socketed drain-pipe, bedded half-way in cement concrete, laid with open joints and covered with rubble, was laid for the remaining distance. As the opening of the whole line from Dore to Chinley depended upon the time occupied in the construction of the Totley tunnel, it was of the utmost importance that it should be constructed in the shortest possible time. The last length of lining was keyed on August 4, 1893, and the tunnel was completed and the permanent way laid by September 2 following.

The Cowburn tunnel was next described. This was 3,702 yards long and was straight from end to end. It cut the axis of the arm of the peak known as Cowburn at right angles. The gradient rose from the Edale entrance at an inclination

Cases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

of 1 in 1,000 for the first 913 yards and fell to the Chinley entrance at the rate of 1 in 150, the difference in level between the two ends being 53 feet. The methods of construction followed were generally the same as for the longer tunnel, but owing to the ground rising steeply at each end there was only one permanent shaft, which was situated at 335 yards from the Edale entrance. A temporary shaft was sunk at the east entrance. In sinking the temporary shaft successive beds of shale and rock were passed through, which brought in large volumes of water, the amount discharged by the pumps reaching over 20,000 gallons per hour. The strata through which the permanent shaft was sunk yielded 24,000 gallons per hour.

A commencement was made with the heading at Chinley on November 26, 1888, the material pierced being rock. The boring plant and air-compressors were fully described. Lar-muth drills were used, and towards the end of the work an improved pattern was supplied which rectified several inconveniences in those first employed. The cross-section and the construction of the lining of the Cowburn tunnel were in all respects similar to those of the larger work at Totley, but the less volume of water met with favoured the construction of the lining in a more systematic manner than at Totley. The ventilation of the workings was also improved. Owing to the difficulty of access to the Edale Valley little was attempted with the lining there until the headings met. This allowed greater opportunity for pushing forward the heading from that end, whilst at the Chinley end the progress of the heading suffered to some extent through the vigour with which the lining was pushed forward. The last length of lining was keyed on December 22, 1892.

The four-chain tunnel at the Dore end of the line was briefly alluded to. It possessed the peculiarity that it passed under very steep sidelong ground at no great depth, and was on a curve of 12 chains radius. In order to allow for the necessary cant of the vehicles on so sharp a curve, and at the same time to enable the tunnel to sustain the unequal load imposed upon it, the cross-section was inclined from the vertical towards the inside of the curve to fit the super-elevation of the outer rails of the permanent way.

The paper concluded with some remarks on the possibility of an increased rate of progress in the construction of tunnels, the author being of opinion that such increase, if possible, would result rather from improved means of removing the refuse from the tunnel-face than from increased speed of boring. In the Totley tunnel the most careful organisation for the

marshalling of waggons was required, and it was only by vigilant care that a sufficient number could be worked in, filled and worked out again in the six hours allowed, whilst the slightest accident caused much delay. The author believed that the use of much larger waggons than those generally employed would be advantageous. They should be made with the body set low and capable of being lifted off the wheels to be tipped. In conjunction with these waggons overhead travelling-skips could be employed, suspended from carriers running on light iron rails attached to the head-trees. These skips could be filled from the top of the heap of *débris* and would, after passing over the first waggon, discharge their contents into the second one.

THE LANDSLIP AT SANDGATE.

A DOVER correspondent of the *Times* writes:—Advantage has been taken of the fine weather to take some temporary precautions to prevent further disaster to the sea wall at Sandgate, which in its present condition is threatened with almost certain further destruction should another south-westerly gale set in. Trenches are being dug at the foot of the damaged wall, and these will be filled with concrete. An inspection of the damage shows that the shingle on the foreshore has been scoured out so as completely to expose the foot of the wall to the action of the sea. The mischief appears to have arisen through the wall being built upon the clay soil beneath the shingle, over which the superincumbent weight has apparently slipped. Sandgate is in a peculiar position with regard to the heavy cost of maintaining the sea-defences. The County Council are responsible for the road as a high road, but they disclaim any responsibility for the foundations of the road, of which they contend that the sea wall forms a part. The Sandgate Local Board, which represents only a small community, claims from the Council the cost of erecting the wall—3,000l.—and the matter, which has been remitted to arbitration, has been delayed from time to time. In the meantime the present serious disaster has happened to the sea wall, the whole of which will almost certainly be carried away, and the road, too, if something is not done very quickly. There is a strong feeling in the town that the question should be forced to a settlement by the wall being left as it is. A meeting of the inhabitants is to be called to discuss the matter. The work of land-surface drainage, rendered necessary by the disastrous landslip of last March, has now been completed.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

EARL LICHFIELD MEMORIAL, GREAT HAYWOOD.

We give an engraving of the beautiful county memorial which has been given by public subscription to the memory of the late Right Hon. the Earl of Lichfield. The engraving, however, could not convey an adequate idea of the memorial in simple black and white, and we must trust to a short description to give a better idea of the memorial. First of all, in regard of dimensions, it is 5 feet 6 inches by 3 feet 8 inches, and it consists of a brass tablet, 4 feet 6 inches by 2 feet 8 inches, emblazoned with arms, coronet and supporters, and engraved with a suitable inscription, the whole being inserted in a 6-inch border of alabaster, richly moulded and carved with oakleaves and acorns. The work was designed and executed by Messrs. Matthews & Co., 19 Castle Street East, Oxford Street, W. The dedication ceremony was performed by the Bishop of Lichfield, Bishop Anson taking part in the ceremony. Amongst those present were the Earl and Countess and

TO THE GLORY OF GOD
AND IN MEMORY OF
THOMAS GEORGE, 2ND EARL OF LICHFIELD.
BORN AUGUST 15TH 1825.
LORD LIEUTENANT OF STAFFORDSHIRE 1863-1871.
CHAIRMAN OF QUARTER SESSIONS 1859-1868.
AND AN ALDERMAN OF THE COUNTY COUNCIL FROM ITS COMMENCEMENT.

THIS TABLET IS ERECTED BY NUMEROUS FRIENDS IN THE COUNTY
IN GRATEFUL RECOGNITION OF HIS PUBLIC SERVICES AND IN
AFFECTIONATE MEMORY OF HIS PRIVATE WORTH.

IN THE DIFFERENCES BETWEEN LABOUR AND CAPITAL HE WAS A JUST
AND SUCCESSFUL MEDIATOR, AND IN HIS DEALING WITH OTHER GREAT
SOCIAL QUESTIONS OF THE TIME HIS ZEALOUS MIND, UNSPARING LABOUR,
AND EQUITABLE JUDGMENT, WERE ACKNOWLEDGED BY ALL CLASSES OF
THE COMMUNITY.

THE MANY INSTITUTIONS WHICH OWE THEIR ORIGIN TO HIS
FORETHOUGHT ARE THE BEST AND MOST ENDURING MONUMENTS OF
HIS WISE AND COMPASSIONATE CARE OF THE SUFFERING AND HELPLESS.
HE DIED JANUARY 7TH 1892, IN THE FULL CONVICTION OF THAT
CHRISTIAN FAITH WHICH HAD BEEN THE LIGHT AND GUIDE OF HIS LIFE.

Blessed are the dead which live in the Lord, that they may rest
from their labours and their works do follow them.—Rev. xiv. 13

Dowager-Countess of Lichfield, Captain Hon. G. Anson, Dowager Lady Vernon, the Earl of Dartmouth (lord lieutenant), the Earl and Countess of Harrowby and others, all the nobility and best families of the county having been present or represented. The work as personally inspected is most meritorious and a credit to Messrs. Matthews & Co., and has been noticed by the leading journals most favourably, as it deserved to be. From the illustration it will be seen that the subject of the memorial was the second Earl of Lichfield, born in 1825 and deceased at the beginning of 1892, having reached the age of sixty-seven years. There is no doubt that he used his time, knowledge and opportunities in working to promote in every way the welfare of all alike, and was a peacemaker in disputes of any kind. It is not therefore to be wondered at that he won the affections of all in the county.

A LARGE clock has just been erected in the church at Shepton Beauchamp, Somersetshire. It has two large dials and chimes the Cambridge quarters on four bells. All the latest improvements have been introduced in the mechanism and it will doubtless keep accurate time. The whole of the work has been executed by Messrs. John Smith & Sons, Midland Clock Works, Derby, who also made the clock at St. Paul's Cathedral.

THE FUTURE CAPITAL OF BRAZIL.

A REPORT from the British Legation at Rio refers to the scheme for founding a new capital in Brazil. The third article of the Constitution provides that a territory to be selected on the central plateau of Brazil shall form a new Federal district where the future capital of the Republic shall be built. Rio de Janeiro will then become the capital of a new State, to be called Guanabara, after the original Indian name of the Bay of Rio, formed out of the present Federal district. In pursuance of this article, the Government appointed, in May, 1892, a commission, with Dr. Cruls, the director of the Rio Observatory, as president, to explore and demarcate the proposed new district. The commission proceeded by rail as far as Uberaba, in Minas Geraes, and thence on mule back to the State of Goyaz. The spot selected is in the vicinity of Pyrenopolis, formerly Meia Ponte and near the Pyreneos Mountains, on a plateau that may be said to be the watershed of Brazil. In this region are the sources of the Araguaya and Tocantins and of several large tributaries of the Francisco and Parana. The altitude of the plateau ranges from 2,950 feet to 4,260 feet, and to show how little this part of Brazil is known, it is mentioned that the highest peak of the Pyreneos Mountains, which was reputed to be 9,840 feet, was found by Dr. Cruls to be only 4,473 feet high. The climate is said to be healthy, and the average temperature is estimated at 66 deg. Fahr., which is rather less than that of Rio. Water and building stone, both granite and limestone, are found in abundance. The centre of the zone measured is 605 miles from Rio as the crow flies, but allowing for inevitable detours this would be increased to 745 miles; and Dr. Cruls takes a very sanguine view in estimating that this distance could be effected in twenty hours, at the rate of 37 miles an hour. This line, and many others, would have to be constructed in order to render it possible to govern Brazil from the wilds of Goyaz, though this may perhaps be used as an argument in favour of the project. The President's message to Congress last year urged the removal of the capital provisionally to some place in the interior, without waiting till the new capital is ready for occupation. In any case, there is no doubt that Rio will always remain from its unrivalled situation the most important city in Brazil, whether it ceases to be the capital or not. The Exploration Commission at least amassed valuable information as to the geography and botany of a region which has been visited by few travellers excepting MM. de Saint-Hilaire and Castelnau.

DRY ROT IN THE TOWER.

A REMARKABLE instance of the growth of dry rot has, says the *Kew Bulletin*, recently been discovered in the armoury of the Tower of London. In November a communication was made to the Royal Gardens from the Horse Guards, War Office, to the effect that on repairing one of the wooden horses in the armoury, believed to be more than 100 years old, a mass of fungus was found in the interior. It was cut out with the portion of wood to which it was attached and sent to Kew, when it proved to be a large and characteristic specimen of the ordinary dry-rot fungus (*Merulius lacrymans*, Jacq.). This fungus, as is well known, is very destructive to timber in close and ill-ventilated situations. The singular circumstance in this case is that it appears to have been arrested in its growth and killed and desiccated before it had produced the smallest fragment of fructification.

WHITE-LEAD SUBSTITUTES.*

THE question of how far white-lead can be replaced as a pigment by other white paints is attracting a good deal of attention at present, on account of a desire on the part of the public to obtain an article which will not entail the suffering from lead-poisoning which accompanies the manufacture of the ordinary pigment. This interest has been especially excited by the publication of Dr. Arlidge's work on "The Diseases of Occupations;" by Dr. Oliver's recent work on "Lead-Poisoning;" and by the "Report of the Home Office Committee on White-Lead Manufactures." The subject is one in which I have taken considerable interest, and have made a few experiments, which I propose to lay before you to-night.

As far as I am aware, there are only two substances at present manufactured which can be regarded as white-lead substitutes—sulphate of lead and oxide of zinc. Sulphate of barium has hardly any covering power, and sulphide of zinc, though remarkable for covering power, has not proved, I am given to understand, a durable pigment, and therefore need not be considered. I have not, however, myself experimented on sulphide of zinc, and would gladly do so with samples from a reliable maker.

* A paper read by Mr. A. P. Laurie, M.A., at the meeting of the Society of Arts.

Oxide of zinc has already obtained an assured position, and is used to some extent in this country, and largely, I believe, in France and in Japan. Its properties as a pigment are fairly well known. It is deficient in covering power, but is remarkably white, and preserves its colour in impure air.

Sulphate of lead is, I believe, at present in the market in two forms—sublimated sulphate, prepared by the Caledonia Works, Glasgow, and precipitated sulphate, ground by Freeman's patent with oxide of zinc, and sold as Freeman's white. The sublimated sulphate is prepared directly from galena. More than one patent for doing this has been taken out, but I believe it is now only being made by the Glasgow White-Lead Company, according to Mr. Hannay's patents. Sulphate of lead prepared by sublimation has much more covering power and is much denser than precipitated sulphate. At the same time, I believe it is difficult to obtain a complete yield of sulphate from the galena, which is of a good white, and not a little grey. This difficulty may, however, have been got over recently. Freeman's sulphate is prepared by dissolving lead, which has been converted into thin flakes, in acetic acid, and precipitating with sulphuric acid. This is washed, pressed and dried. Alone its covering power is poor. It is then ground with about 20 per cent. of oxide of zinc and a little barium sulphate, under heavy edge-runners. The result is a pigment of much greater density and covering power than either of its constituents. There is another pigment being sold as a harmless white-lead by the Patent Lead and Zinc White Company, which is prepared in a similar way by grinding together oxide of zinc and sulphate of barium. This process is based, I believe, on an abandoned patent by Mr. Freeman for preparing condensed oxide of zinc by grinding oxide of zinc under heavy edge-runners.

The following samples illustrate the reduction in bulk of the powder produced:—

1. By grinding together the zinc oxide and precipitated lead sulphate.

2. By grinding zinc oxide alone.

The reduction is very remarkable, and suggests an interesting problem in molecular physics. Mr. Freeman has supplied me with some interesting facts about the results of grinding these substances dry under heavy edge-runners. Before grinding the mixed oxide and sulphate weighs 120 lbs. to the cubic foot, and takes 12 lbs. of oil to the hundredweight. After grinding it weighs 199 lbs. to the cubic foot, and takes 7 lbs. of oil to the hundredweight. A comparison of the pro-

perties of some of these pigments with ordinary white-lead reveals some interesting results.

In the first place, with reference to the quantities of oil required to grind these pigments—

One cwt. of	Takes lbs. of oil.
White-lead (stack process)	9
White-lead (precipitated)	12
The Glasgow lead sulphate	12
Zinc oxide	25
Zinc oxide (condensed)	16
Freeman's white	7

It will be noticed that, in the quantity of oil required, these white-lead substitutes compare well with white-lead, some taking a little more and some a little less, except oxide of zinc, which takes a very large quantity.

In the second place, with reference to their susceptibility to impure air.

Here all these substitutes have a distinct advantage over white-lead, for the zinc oxide is quite unaffected, and the sulphate is very slightly affected, unless the gas is in very large quantities and the paint wet. This panel shows distinctly the difference between white-lead and Freeman's white in this respect. It was exposed to sulphuretted hydrogen some time ago, and the white-lead has to some extent recovered, being almost black at first.

It is a matter of surprise that these whites are not universally used in place of white-lead for internal work in London, where white-lead discolours so quickly. I am sure the general public would insist upon it if they knew how much it would save them in cost of painting.

The most important question is covering power. Oxide of zinc, prepared in the usual way, is of course distinctly inferior to white-lead, but I could not find any proof that special preparations of lead sulphate and zinc oxide were also deficient. In fact, Professor Church, in his book on "Pigments," distinctly states that Freeman's white has about the same covering power as white-lead. I tested the covering power of these pigments in the following way:—

The outside of my laboratory is covered with weather boarding, which has had two or three coats of white-lead. I selected a certain number of boards and painted black strips down them at equal distances apart, so as to count the surface into alternate black and white strips 3 inches broad. Each board was 6 inches broad, and I covered 10 feet in this way, so that each board represented a surface of 5 square feet. I

next took equal weights of the best stack lead, of the Glasgow sulphate, and of Freeman's white, as sent out ground in oil by their respective makers.

I next employed a skilled house-painter, who added thinning, made of equal parts of oil and turps. He added the oil and turps until satisfied with the consistency of the paint. In each case 200 grammes of the paint was taken. The thinnings weighed respectively—

	Grammes.	Thinning	Grammes.
White-lead	200	..	41
Freeman's white	200	..	39
Glasgow white	200	..	45

He then painted in a coat of each paint along the board. The coats weighed respectively—

	Freeman's white.	Glasgow white.	White-lead.
First coat	30	28	33
Second coat	30	28	36
Third coat	43	28	40

The black checks had very nearly disappeared from white-lead and Freeman's white.

Fourth coat	53
-------------	----	-------	-------

The checks had now disappeared completely from the Glasgow white. This last coat was laid on by an unpractised hand, and was consequently unnecessarily thick. Another coat of 28 grammes would have been sufficient.

Consequently, the weight of paint used is in every case practically the same. The black checks were very faintly visible under the white lead; slightly more so in the case of Freeman's white; they were quite invisible for the Glasgow white.

The Glasgow sulphate, however, required four coats, each weighing less than a coat of the other pigment. The extra thinning added will not entirely account for this, and it is probably due to the extra amount of oil with which the colour is ground. Doubtless this slight defect in the sample sent to me can be overcome.

The next question of interest is the durability of the coating formed by these pigments for outdoor work. I have not had sufficient time to test this question properly. I made a rough experiment, by sizing a piece of canvas, and painting one-half with white-lead and the other half with Freeman's white, and hanging it up out of doors to flap in the wind. After six months they were both badly cracked, but one seemed no worse than the other. I presented the canvas to the White-Lead Com-

mittee. Oxide of zinc is supposed not to stand exposure so well as white-lead, and probably as it has been long in use this opinion is correct. About the durability of the whiteness there can be no question. This painting was done last June; I washed it a few days ago, and then examined it carefully. The white-lead is a dirty grey. The Glasgow white and Freeman's white have kept their colour well. The Glasgow white is covered with minute cracks, and the Freeman's white has grown slightly translucent.

Since these experiments, I have tested the covering power of condensed zinc oxide; 100 grammes of the paint took 32 grammes of thinning. Three coats weighed 25, 22, 25 grammes. The black marks were then just vanishing, so that this pigment gave the best results of all.

Next we come to the working qualities of these pigments and their consistency in oil. Their appearance in oil differs considerably from that of white-lead, being thin and stringy instead of stiff and firm; and I have no doubt this is against them. I do not find, however, that when thinned down they seem to differ appreciably from lead carbonate in ease of working. I cannot, however, pretend to speak authoritatively in this matter, but I can speak on the question of their suitability for artists' use.

I may say at once that, as sent out by the different makers, I found them quite unsuitable. An artist expects his colour to squeeze out from the tube crisp and firm, and to work with perfect ease under the brush without running. As I was anxious to introduce them to artists, I cast about for some way to get over this difficulty, and, finally, devised one which I propose shortly to describe. It is generally understood that white-lead owes its peculiar properties partly to the fact that it saponifies with the oil. This has, I am aware, been disputed by Mr. Hannay, but I have assumed the exactness of this belief in making my experiments.

Evidently, so stable a compound as lead sulphate could hardly be expected to saponify with the oil, but it seemed to me quite possible that oxide of zinc would do so. I therefore treated some oxide of zinc ground in oil with light petroleum spirit, and found that besides dissolving the oil, the petroleum spirit had dissolved a very small quantity of zinc (.02 per cent.), which showed that a zinc soap was present, but in very minute quantities. Evidently, then, the zinc oxide was not able to decompose the glycerine fatty acid compounds. On the other hand, if zinc oxide is ground with free fatty acid it combines to form a soap (oleic or linoleic). I therefore tried the effect of

ment, Municipal, or other Contracts of every description at
moderate rates. Office, 61 Moorgate Street, London, E.C.
The Bonds of this Company are accepted by the several
Government Departments.

adding small quantities of linoleic and oleic acid to the oil in which the oxide of zinc was ground. I found this at once acted in a remarkable manner, converting the thin mixture into a stiff mass, closely resembling white-lead. The free fatty acid acted in a similar manner on Freeman's white, so as to convert it into a stiff mass, which completely deceived house-painters who had long been familiar with white-lead. On treating this pigment with petroleum spirit, I dissolved out a considerable quantity of zinc soap. By adding more oil I obtained all the requirements in consistency and ease of working necessary for the artist. This method of grinding zinc oxide, which I have protected by patent, is I believe well worth trial on the large scale for ordinary purposes.

There is still a further matter which I have not touched on, and that is how far these pigments are non-poisonous.

Oxide of zinc is, I believe, quite harmless. Sulphide of lead is not absolutely insoluble in very weak hydrochloric acid. On three occasions I digested well-washed precipitated lead sulphate in '3 per cent. hydrochloric acid at 100 degrees Fahr. for three hours, in this way roughly representing the action of the stomach, though, of course, with rather stronger acid (the hydrochloric acid in the stomach is about '02). In each case I digested 1 gramme with 50 cc. of the '3 per cent. hydrochloric acid. I found—

- | | | |
|-----|-------|------------------------------|
| (1) | '0072 | grammes of lead in solution. |
| (2) | '0121 | " " " |
| (3) | '0090 | " " " |

'0283 giving a mean = '0094.

of lead dissolved in each case, showing that about 1 per cent. is dissolved under these conditions. Probably, therefore, sulphate of lead is slightly soluble in the stomach, and therefore to some extent poisonous. I do not, however, believe that, under ordinary conditions of manufacture or use, lead sulphate would produce lead poisoning, nor would one or two doses swallowed do any harm. Nothing but repeated doses in considerable quantity would probably produce lead poisoning, and this does not happen under ordinary circumstances.

In conclusion, I should like to point out that this question of white-lead substitutes is part of a very large subject, namely, how we can render our various industrial processes harmless to those employed. For this century, our scientific knowledge and inventive genius have been devoted to increasing the rate of production and cheapening the article produced. I hope the time is now coming when our scientific knowledge and

inventive power will be directed into a new channel, and will be devoted to rendering our manufacturing processes, of whatever kind, healthy for those employed.

As a step in that direction, I venture to suggest that the Society of Arts might well take up such questions, and by special inquiries promote the introduction of harmless substitutes and better processes. This question, for instance, of white-lead substitutes is ripe for a special inquiry by some body of recognised standing.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

849. George Mewburn Stonehouse and Thomas Richardson White, for "Boiler and other flue cleaners."

889. Edward Francis Hutchins, for "An improved ventilating apparatus for window-sashes."

904. Wladimir Khlebuikoff, for "Improvements in smoke-consuming furnaces."

933. George Rose, for "Improvements in apparatus for extinguishing fires and for other purposes."

942. John Stow, for "Improvements in the construction of door and other similar bolts."

995. Teile Henry Müller, for "Improvements in furnace grates."

1047. Henry Birkbeck, for "Improvements in or in connection with collapsible doors."

1176. Thomas Joyce, for "Improvements in water-pipes."

1209. Alfred Carey, for "A new or improved chimney cowl."

1304. Walter Judd, for "Improvements in means for preventing water-pipes bursting from frost."

COMPETITIONS OPEN.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

KIRKCALDY.—March 17.—Plans, &c., are invited for proposed Beveridge Public Hall, Free Library and Adam Smith Memorial Hall, &c. Mr. W. Roy Spears, Town Clerk.

MACHYNLLETH.—Feb. 28.—For Scheme of Water Supply and Sewerage. Premium of 40% is offered. If the Engineer whose scheme is selected is appointed to superintend the execution of works, the premium merges into his commission. Mr. David Humphreys, Inspector of Nuisances, Machynlleth.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150% and 50%, premium to merge. Mr. H. H. Hicknott, Town Clerk.

CONTRACTS OPEN.

ALMONDBURY.—Feb. 15.—For Building Dwelling-house. Messrs. John Kirk & Sons, Architects, Huddersfield.

ANTRIM.—March 5.—For Building Lunatic Asylum at Holywell. Mr. J. Lanyon, Architect, Northern Bank Chambers, Royal Avenue, Belfast.

ARMLEY.—Feb. 17.—For Alterations to Town Schools. Mr. C. F. Wilkinson, Architect, 35 Park Square, Leeds.

BARKEREND.—Feb. 9.—For Building Residence and Stabling. Mr. James Ledingham, Architect, District Bank Chambers, Bradford.

BATTERSEA.—Feb. 14.—For the Supply of Alderney Granite, Cornish and Enderby Stone, Oils, Paint, the Removal of Road Grit, &c. Mr. W. Marcus Williams, Vestry Offices, Battersea Rise.

BATLEY CARR.—Feb. 16.—For Building Six Dwelling-houses. Messrs. P. Spencer & Son, Architects, Batley Carr.

BEDWAS.—Feb. 17.—For Building Board School and Additions to Bridge School. Mr. Evan Davies, Architect, Maescymmer.

BELFAST.—Feb. 14.—For Building Four Houses and Shops. Mr. F. W. Lockwood, Architect, 16 Waring Street, Belfast.

BELFAST.—Feb. 15.—For Building Church. Mr. Samuel P. Close, Architect, 53 Waring Street, Belfast.

BELFAST.—For Building Nelson Memorial Church. Mr. W. H. Stephens, 41 Donegall Place, Belfast.

BENTLEY.—Feb. 10.—For Additions to Board School. Mr. C. J. Innocent, Architect, 17 George Street, Sheffield.

BIRKENHEAD.—Feb. 19.—For Boundary and Retaining Walls, &c., for Refuse Destructor Site. Mr. C. Brownridge, Borough Engineer.

BRADFORD.—Feb. 10.—For Building Two Wool Warehouses. Messrs. Brayshaw & Dixon, Architects, Bowling Old Lane, Bradford.

BRADFORD.—Feb. 19.—For Building Business Premises. Messrs. Empsall & Clarkson, Architects, Tyrrel Chambers, Bradford.

BRADFORD.—Feb. 19.—For Building Store and Two Houses. Messrs. Rycroft & Firth, Architects, Bank Buildings, Manchester Road, Bradford.

BRIDGEND.—Feb. 9.—For Building Vicarage, Ogmore Vale. Messrs. Halliday & Anderson, Architects, 13 Duke Street, Cardiff.

BRISTOL.—Feb. 12.—For Additions to Premises, Lloyds Bank. Mr. H. Williams, Architect, 28 Clare Street, Bristol.

BURSLEM.—Feb. 21.—Additions and Alterations at Chell Workhouse. Messrs. Ford & Slater and Mr. Walley, Joint Architects, Burslem.

CARDIFF.—Feb. 10.—For Building Male Nurses' Rooms at Workhouse. Mr. E. Seward, Architect, Queen's Chambers, Cardiff.

CARLISLE.—Feb. 14.—For Additions to Court Houses. Mr. G. D. Oliver, County Architect, The Courts, Carlisle.

CHICHESTER.—Feb. 21.—For Additions to Workhouse and Works of Drainage and Water Supply. Messrs. Inkpen & Swinburne, South Street, Chichester.

CHORLEY.—Feb. 20.—For Building Wesleyan Chapel. Mr. W. H. Dinsley, Architect, 20 High Street, Chorley.

CRADLEY.—Feb. 9.—For Building Police Station, Cells, &c. Mr. Henry Rowe, County Surveyor, Worcester.

CROSSGAR.—Feb. 9.—For Additions to House. Mr. Robert Watt, Architect, 77A Victoria Street, Belfast.

CYMMER.—Feb. 14.—For Building Baptist Chapel. Mr. H. Abraham, Porth, Pontypridd.

DEWSBURY.—Feb. 9.—For Building Two Semi-detached Houses. Messrs. Holtom & Fox, Architects, Westgate, Dewsbury.

DORCHESTER.—Feb. 9.—For Repairs to Premises, High West Street, for the Joint Committee of the County of Dorset. The County Architect, Shire Hall, Dorchester.

ERITH.—Feb. 12.—For Building Cemetery Chapels, House, &c. Mr. F. Parish, Clerk to the Local Board, High Street, Erith, Kent.

FAREHAM.—Feb. 26.—For Building Block for Fifty Children at County Lunatic Asylum. Mr. B. S. Jacobs, Architect, Lincoln's Inn Buildings, Hull, and 88 Bishopsgate Street, E.C.

FULHAM.—Feb. 14.—For Making-up and Paving Munster Road. Mr. J. P. Norrington, M.I.C.E., Town Hall, Walham Green, W.

GLOSSOP.—For Additions to Friendship Inn. Mr. J. H. Burton, Architect, Wellington Street, Ashton-under-Lyne.

GREENFIELD.—Feb. 14.—For Building House near Reservoir. Messrs. John Eaton & Sons, Architects, Stamford Street, Ashton-under-Lyne.

HALIFAX.—Feb. 10.—For Additions to Higher Grade Board School and other Works. Messrs. Horsfall & Williams, Architects, 15 George Street, Halifax.

HAMMERSMITH.—For the Supply of Materials and Execution of Works for a Period of Twelve Months. Mr. W. P. Cockburn, Vestry Hall, Broadway, Hammersmith.

KENDAL.—Feb. 10.—For Building Mission Room. Mr. Stephen Shaw, Architect, Kendal.

KEYNSHAM.—For the Erection of Schools. Mr. E. H. Lingen Barker, 146 St. Owen's Street, Hereford.

LEEDS.—Feb. 12.—For Extension of Electric Lighting Station. Messrs. Milnes & France, Architects, Bradford.

LEEDS.—Feb. 19.—For Building Public Baths. Mr. Walter Hanstock, Architect, Branch Road, Batley.

LIMEHOUSE.—Feb. 19.—For General Works and Repairs to Foot and Carriage Ways, Sewers, Drains, &c., and the Supply of Broken Guernsey Granite, for a Period of One or Two Years. Mr. Sidney G. Ratcliffe, District Board Offices, White Horse Street, E.

MALDON.—Feb. 9.—For Building Villa. Mr. P. M. Beaumont, Architect, Maldon.

MONMOUTH.—For the Erection of Twelve Cottages and the Completion of Nine Others at Abertillery, near Newport. Messrs. Bishop & Pritchett, Regent's Circus, Swindon, Wilts.

MOSS SIDE.—Feb. 12.—For Building Board School, House and Board Offices. Messrs. Potts, Son & Pickup, Architects, 34 Victoria Buildings, Victoria Street, Manchester.

HALLIDAY'S CLAPTON LIGHTS.

Simple, Powerful, Economical. Reflection and no Complication.

OPEN TOP, AS SHOWN, OR VENTILATING. PLAIN OR ORNAMENTAL.

Much used in Places of Worship, Lecture Halls, Board Schools, Shops, Large Offices, Markets, &c.

Suitable for wherever a Very Powerful, Well Diffused, Soft, Economical, and Easily Managed Gas Light is desirable. Made in Five Sizes.

HONoured WITH SUNDRY IMITATIONS.

Seven years from Invention up to April 1890 over 11,300 sent out. But

Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong.

R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

J. C. HALLIDAY,

LONDON AND GENERAL WATER PURIFYING COMPANY'S, LIMITED,

House Cistern fitted with a Cistern Filter.

PATENT CISTERN FILTERS. Charged Solely with Animal Charcoal. Requiring, when once fixed, NO attention whatever, and superior to any others. Vide Professor Frankland's Reports to the Registrar-General, July 1866, November 1867, and May 1870. The Lancet, January 12, 1867.

Also, Testimonials from Dr. Hassall, September 23, 1863; the late Dr. Letheby, February 15, 1865, and December 1872.

Price, £1 10s. and upwards.

Portable Filters on this System, £1 5s. to £3.

Patronised and used by Her Majesty the Queen at Osborne, by H.R.H. the Prince of Wales at Sandringham, by H.R.H. the Duke of Edinburgh at Eastwell, by H.R.H. the Duke of Connaught at Bagshot Park, by H.R.H. the Duke of Cambridge, the élite of the Medical Profession and at the London, Middlesex, St. George's, St. Mary's, Consumption, Fever, and German Hospitals, and various Lunatic Asylums, Institutions, Breweries, &c., and at all the Schools established by the School Board for London. Pocket Filters, 4s. 6d. and 6s. each. Household and Fancy Filters, from 10s. Water-testing Apparatus for detecting Impurities in Water, 10s. 6d. and 12s. each.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

Portable Cistern Filters.

TRADE NOTES.

THE January return of the Cleveland Ironmasters' Association shows the following as the month's makes of pig-iron, namely, 102,000 tons of Cleveland iron and 122,000 tons of other kinds, a total of 224,000 tons; or 1,000 tons more than in December. There are 86 furnaces blowing, 44 of which are making Cleveland iron. The stocks increased 8,600 tons in January.

ACCORDING to the *Standard*, the further examination by experts of the well at Ashwick Court, near Shepton Mallet, shows unmistakably the existence of crude petroleum oil. The volume of water, owing to the rains, has, notwithstanding the pumping out of some hundreds of thousands of gallons, prevented the thorough emptying of the well. Boring operations will, the *Standard* says, be awaited with considerable interest.

WE mentioned last week that the new scheme for the supply of hydraulic power by the Manchester Corporation was successfully put into operation. The first supply of water was given to a set of hydraulic lifts erected by Messrs. Archibald Smith & Stevens in the new Mosley Hotel and adjoining premises. The new power will be regularly available in a few days.

MESSRS. RATCLIFF & HORNER have received from one foreign Government an order for seventy-eight large safes, and from another Government an order for sixty-one safes of their improved construction.

WE are informed that Messrs. Baird, Thompson & Co., ventilating, heating, &c., engineers, have recently acquired the splendid freehold property known as Charlton Engineering Works—also the property adjoining—together with the machinery and plant contained therein, and they are having the same fitted up with all the most recent improvements and labour-saving appliances suitable for their engineering and manufacturing requirements. The Charlton Works, which cover a large area, are centrally situated, being almost opposite the entrance to the Agricultural Hall, Islington, N., and it is claimed that when completed they will be the largest and finest in the trade, proving a most valuable acquisition in enabling this enterprising firm to cope with their largely-increasing business. The whole of the buildings are to be lighted by electric light.

THE Health Committee of the Birmingham Town Council have reported that they obtained tenders for the erection of the two additional pavilions, with the administrative buildings,

&c., at the Yardley Road Hospital. The estimate laid before the Council for the building of the hospital of four pavilions amounted to 25,940*l*. This included 2,850*l*. for engineering works (boiler, engine, laundry and cooking apparatus, disinfecter, &c.). The lowest tender received, that of Mr. W. Robinson, amounted to 25,282*l*. Adding to this 4,718*l*., the amount of the accepted estimate for the two pavilions, and 2,850*l*., the cost of engineering works not included in Mr. Robinson's tender, brought the cost of the work to 32,850*l*., or 6,910*l*. above the estimate reported to the Council. This decided the committee to omit the nurses' home from the present contract, bringing the amount of Mr. Robinson's tender to 18,742*l*. The first two pavilions are practically completed.

THE contract for the construction of the Burgas harbour works has been given to a Belgian company, which has offered to undertake the work for 4,230,000 francs, this tender being the most favourable sent in.

AT the meeting of the Leighton Buzzard Local Board a tender from Messrs. Garlick & Horton, London, was accepted for the execution of works of sewerage and water-supply, erection of water-tower and pumping-stations, supply of pipes, machinery, &c., under Contract No. 2, in accordance with plans and specifications by Mr. H. B. Nichols, engineer, at a sum of 18,987*l*.

VARIETIES.

MESSRS. ARCHIBALD SMITH & STEVENS, hydraulic engineers, Battersea, S.W., have presented their compliments to their clients in the very pretty and useful shape of a set of ivory tablets for pocket use. The memo tablets can be cleaned with a damp cloth for reuse, and there is abundance of space for jotting down memos. A calendar is printed in gold on the outside; also a beautiful specimen of one of Messrs. Archibald Smith & Stevens's hydraulic lifts.

ONE of the finest mansion-houses in Ireland, Lisbeg, the residence of Mr. John Gairdner, J.P., situated near Eyrecourt, co. Galway, has been destroyed by fire. It was erected about twenty-five years ago, 20,000*l*. being expended on it.

THE Mersey Dock Board have under consideration a proposal to erect on the north quay of the Hornby Dock a shed 1,430 feet long and 125 wide, at a cost of 60,000*l*. An improvement was

THEATRES, ETC.

rendered necessary owing to the present accommodation being inadequate for the trade of the port.

THE Local Government Board have notified their consent to the borrowing of 21,000*l.* by the Birkdale Board for purposes of sewage disposal.

At a special meeting held at Sunderland, the River Wear Commissioners resolved to accept an offer of the Public Works Loan Commissioners to lend the Board 175,000*l.* in order to complete the projecting piers at Sunderland harbour, and so render the port practically a harbour of refuge for the north-east coast. The works are in progress, and when finished the piers will be about a mile each in length, the work to be finished in seven years.

THE Local Government Annual for 1894 has been published, this being the third year of publication. No more valuable publication could be wished for, as it gives the names and addresses of the chief officials of all corporations, county councils, boards of guardians, urban and sanitary authorities throughout the kingdom, vestries, district boards, &c. Several improvements have been made in this volume, for the editor has this year added a complete list of the burial boards of England and Wales, with the names of the clerks. These occupy twenty-five additional pages. Besides these, he has added the names of the medical officers of the different corporations and the amount of the last yearly rate made by the London vestries. Ample space is afforded for memos and notes in the pages devoted to the diary. Looking to the fact that during the present year great changes will be made in local government, the Annual will be found to be of special value to all interested in public work.

MR. PARSONS, the superintendent of the parks in New York, reports that no further disintegration, even of the slightest kind, of the obelisk in Central Park, has been observed since the application to it of paraffin in 1885. Another coating was given last year to insure absolute preservation. The paraffin has sunk 6 inches into the stone.

THE Carpenters and Joiners' unions of Montreal are said to have recently made arrangements with most of the contractors of that city whereby in future nine hours shall constitute a day's work. The unions are also said to have determined a standard day's pay for all carpenters, the enforcement of which will be attempted after May 1 next.

THE *Manchester Guardian* says:—The Fire Brigade Subcommittee of the City Council has lately been considering the means of escape from lofty buildings in Manchester in case of fire. A list has been compiled of the premises where persons are known to reside above 50 feet from the ground, which is the extreme height to which the Brigade fire ladders can reach. The sub-committee recommend that a letter should be addressed to the persons interested, pointing out that it is incumbent on them to provide, at their own expense, sufficient means of escape in case of fire.

MESSRS. C. KITE & Co., of the Christopher Works, Chilton Street, Euston Road, have just carried out the ventilation of the Avenue Road Schools, Norwich; the new parochial offices, Brighton; new Admiralty extension, Whitehall (where about 600 ventilators have been fixed); at the Leicester Street and Shrubland Street Schools, Leicester; new markets, Halifax; and the York Building Board Schools, Southampton. Messrs. C. Kite & Co. are contractors to the Admiralty, War Office and Office of Works, and they received the highest award for exhaust ventilators at the International Health Exhibition of 1884.

THE paved streets of Chicago now have a length of about 1,016½ miles. Nearly 659 miles are paved with cedar, about 311½ miles are macadam roads, 25·3 miles have stone-block pavements, 20 miles have asphalt, and one mile is supplied with a vitrified brick surface.

IT is stated that Sir Thomas G. Carmichael, Bart., of Castle Craig, has supplemented his gift of bronzes to Selkirk Public Library by sending other four bronze reproductions from Naples. The figures represent Bacchus, Silenus, a faun and a drunken wine carrier. The originals were recovered from Pompeii or Herculaneum, and the Selkirk duplicates are reproduced in such a way as to show exactly the appearance of the bronzes on their being dug out after having lain about two thousand years in the lava or volcanic dust.

THE *Standard's* correspondent at Athens says:—Herr Noate, a young member of the German Institute, delivered an interesting lecture yesterday on some discoveries he has made in the dry bed of Lake Copais. He claims to have found there the remains of three large cities, one of which is greater in extent than Mycenæ and Tiryns together. He ascribes the works, which are admirable in form, to an ancient race of the dynasty of Minyæ, while the walls of the towns point unmistakably to the Mycenæan epoch.

B. E. NIGHTINGALE, Builder & Contractor,

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

At Sheffield a meeting of the Jubilee Committee was held to consider an offer from the Town Trustees to sell to the Corporation for 7,000*l.* a plot of land in Church Street, adjoining the Gladstone Buildings, for the erection of a central free library and reading-room. The committee recommend the Council to purchase the land if the Town Trustees will contribute 3,500*l.* towards the cost of the site, the Corporation to proceed with the erection of the building as soon as the state of trade has sufficiently improved to warrant the expenditure of the money.

In the northern part of Washington County, N.Y., within a circle less than fifteen miles in diameter, are said to be the only red slate quarries ever found. There are two parallel veins about five miles apart, the one known as the Granville vein being best adapted for roofing purposes; the other, in Hatch district, and of softer quality, can be sawed into floor tiles and house trimmings. The material is very costly.

THE Stretford Local Board have resolved to proceed with the scheme for the erection of "destructors" and "sanitary dépôts" at Old Trafford and Longford Bridge, if the necessary loan can be obtained.

THE *Scotsman* says:—Work in connection with the construction of new dry and deep water docks at Leith has been somewhat unexpectedly stopped, all the workmen employed by the contractors, Messrs. Kinnear, Moodie & Co., having been paid off on Saturday afternoon. No official communication has as yet been sent to the Dock Commission regarding the matter, but it is understood that the suspension of labour has been occasioned by the recent death of the managing partner of the firm of contractors.

At the meeting of the General Purposes Committee of the Goole Town Council, it was decided to advertise for plans for the erection of a new market hall and shops to be built on the old site. The plans are open to competition, the first prize 100*l.* and the second 50*l.*

ELECTRICAL.

THE *Engineering Record*, New York, says:—Underground conduits in New York city now have a length of 1,667 miles. In these conduits there are about 32,600 miles of telephone and telegraph wires and 1,300 miles for wires for lighting purposes, with which about 6,790 arc lights and 268,000 incandescent lamps are connected.

THE Sanitary and Lighting Committee of the Scarborough Corporation have decided to adopt electric lighting at the Town Hall.

THE Blackpool Town Council have resolved to enlarge the municipal gasworks and the electric light works; 45,000*l.* was voted to the former, and although the latter have only been running four months, a further sum of 24,000*l.* is to be spent on new plant.

BUILDING AND BUILDERS.

At a public meeting held in Swansea, enthusiastic support was given to a scheme for building a church on the site of the present church of St. Mary.

THE new technical school at Lynn has been opened by the Duke of York. Among others, Mr. E. J. Silcock, the architect of the building, was presented to the Duke, the contractors being Messrs. Jarvis & Melton, and Mr. D. Clack clerk of works.

IT has been decided to erect a small-pox hospital for Bradford.

CHRIST'S HOSPITAL.

At the meeting of the Commission of Sewers on Tuesday Mr. H. G. Smallman, chairman of the Sanitary Committee, reported that plans and specifications for the temporary drainage of Christ's Hospital had been submitted by the authorities of the institution, and he moved that they should be referred to the Sanitary Committee to take such action as they might deem advisable with a view to the speedy reoccupation of the school. In this modified scheme, he said, the whole of the boys would not return, and those who were sent back would have 30 per cent. more cubic space than formerly. He thought they ought to assist the hospital authorities as far as they could in their endeavour to retain the school in its present site until its final removal to Horsham a year or two hence. But of course they must have due regard to their medical officer's report. Mr. Morton, M.P., said this was a proposal deliberately to influence the medical officer and the committee in their decision to send some hundreds of children back to an insanitary building, and he objected to it. Dr. Sedgwick Saunders, medical officer of health, said he should approach these plans with an open mind, and he should be especially glad if the Christ's Hospital site could be only used for a day school at present. The matter was referred to the Sanitary Committee.

THE CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

A PAPER was read at the meeting of this Society by Mr. A. Fairlie Bruce on the "Rosario Sewage Works." The author commenced his paper by stating that public attention was not forcibly drawn to the unhealthy condition of the town of Rosario, in the Argentine Republic, until the cholera outbreak of 1886 aroused attention, and that plans for a system of drainage were then prepared by Mr. Featherstonhaugh and accepted by the authorities the following year. He then went on to describe the system adopted for the sewers, the town being divided for drainage purposes into three districts, namely, the Mendoza, Santa Fé and Catamarca. The Mendoza section has an area of about 1,200 acres, of which 740 are drained. The main sewer is oval in shape, has a sectional area of 25 square feet, a gradient of 1 in 500, and a discharge of 7,611 square feet per minute, equal to one-tenth of an inch of rainfall per hour. The heaviest recorded rainfall for four years was $3\frac{1}{2}$ inches in six hours and only a quarter to one-fifth of the rain reaches the drains. The sewage is discharged into the river Parana. Various interesting details were given of the work and its construction in the district just named, after which the districts of Santa Fé and Catamarca were dealt with. Allusion was made to the foul condition that the soil was in and the difficulties experienced in consequence in carrying out the tunnelling work, of which there was a large quantity, many men having suffered from blood-poisoning. The breakage of the iron pipes in unloading from the ships was only 1·1 per cent., and that of the stoneware pipes 2·6 per cent. Extracts were next given of reports of Sir Joseph Bazalgette and others as to the inappreciable effect of the discharge of the sewage into the river Parana. The author was the resident engineer, and Messrs. J. G. Meiggs, Son & Co. were the contractors.

REGISTRATION OF PLUMBERS.

THE Mayor of Leeds presided at the fourth annual meeting of the local district council for the National Registration of Plumbers just held in the Philosophical Hall, Leeds. There was a large and representative attendance, and among the gentlemen on the platform, were:—Mr. W. H. Bishop (past master of the Worshipful Company of Plumbers), Mr. J. Wreghitt Connon, F.R.I.B.A. (president of the District Council), Councillor Lee, Rev. Chas. Hargrove, Mr. C. Wood (waterworks superintendent), and various master and operative plumbers. The annual report of the Council was read by the hon. sec., Mr. W. Braithwaite. This went to show that the work of the Council had made satisfactory progress during the year; that the number of registered plumbers in the district now stands at 340; and that the local, practical and theoretical plumbing classes had been very well attended during the past session, and a good proportion of the students had passed satisfactory examinations—one of the successful students (A. Britton) having been admitted to the honorary freedom of the Worshipful Company of Plumbers. The Council again warmly thanked the authorities of the Leeds School of Science and Technology for allowing their rooms to be used for meetings of committees and the holding of the plumbing classes. It was reported that the Halifax Corporation have now followed the example set by the County Council for the West Riding of Yorkshire and have decided to employ only registered plumbers in the execution of municipal work. The Mayor, in moving the adoption of the report, said that scamped work in any department was bad; but faulty work in connection with plumbing had been known, as they were all aware, to have caused terrible disease and death to run riot in large households. Any efforts which they could make to meet this state of affairs, and to give those engaged in plumbing-work that knowledge without which they could not do it properly, would receive the hearty support of the public generally. Referring to the fact that some towns employ none but registered plumbers in the execution of municipal work, his Worship said that he thought it was only reasonable to hope that Leeds would shortly, with other towns, refuse to allow plumbers to engage in work for it without the guarantee that was given by registration, that they were, at any rate, able to do the work as it ought to be done. A resolution was passed in support of the Bill before Parliament for registration of plumbers, as "a measure calculated to benefit the public by tending to improve the sanitary condition of dwellings."

THE NATIONAL Building Trades Exhibition.

The First of a New Series under Fresh Management

WILL BE HELD AT THE

ROYAL AGRICULTURAL HALL, LONDON,

MARCH 16 to 31, 1894.

The Consultative Council, consisting of gentlemen of high repute in the Professional and Manufacturing World, are taking special interest in this Exhibition to secure a greater development of Trade in connection with the Building Industries.

THE TIDAL WEIR AT GLASGOW.

A REPORT has been presented to the Town Council by the committee on the erection of a tidal weir across the Clyde at the Green, with movable sluices on the same principle as the Richmond weir. The cost of re-erecting the weir would probably not exceed 45,000*l.* The committee also considered a scheme by Messrs. Ransomes & Rapiers, and visited the works of the Manchester Ship Canal, where a large number of their patent sluices were seen in course of construction and in actual operation. The sub-committee, after consideration of the whole matter, were agreed that, while the advantages that would be secured by the erection of the tidal weir were sufficiently great to warrant them recommending the proposal to the Town Council, the commercial benefit which would accrue to the Clyde Trustees in the improved condition of the navigation could not be over-estimated. They were therefore satisfied that the expense of erecting the weir—if the work was undertaken—should be equally divided between the two representative bodies. The sub-committee further stated that when an opportunity occurred of investigating the working of the Richmond weir they expected to be so much strengthened in their opinions as to recommend the Town Council to make the requisite application to Parliament next year for authority to proceed with this most important undertaking.

It was agreed to delay consideration of this minute till next month, Mr. Richmond stating that the kind of weir to be put up would be one of movable sluices and not a fixed weir, and that there would require to be negotiations with the Clyde Trust and other parties, and after that the matter would again come before the Town Council.

THE ANTWERP EXHIBITION.

A MEETING of the executive committee of the British section of the Antwerp Exhibition was held at the Mansion House on Saturday, the Lord Mayor presiding. Mr. James Dredge read a report on the recent visit of Mr. Walter H. Harris and himself to Antwerp, and the present position and future prospect of the British exhibit. They found that Mr. de Courcy Perry, the commissioner-general of the British section, had already received a very large number of applications for space, and that he had concluded more than one hundred contracts for space in the British section. They saw no reason to fear that Mr. Perry would not fill the large amount of space for which he was

responsible to the Belgian authorities. It was hoped that, with the aid of the chambers of commerce and the mayors throughout the kingdom, the demands for space would justify Mr. Perry in securing an additional 50,000 square feet within the main building, for which he had an option. The central court of the British section was about 80 feet wide and 160 feet long. The names of Sir Myles Fenton, of the South-Eastern, and Mr. Gooday, of the Great Eastern Railway, were added to the committee, and on the motion of Sir Albert Rollit the secretaries were directed to apply to the various railway and shipping companies trading between London, Hull, Leith, Grimsby, Harwich and Antwerp for details as to their charges for the carriage of passengers and goods to Antwerp during the term of the exhibition. The Lord Mayor, in reply to a question, said he had every expectation of being able to visit the exhibition in July next. Sir Joseph Barnby said if the expenses were guaranteed, he was prepared to take 200 pupils of the Guildhall School of Music to Antwerp, and to give two concerts a day for a week, in order to show the Belgian people and the visitors to the exhibition the perfection of English music. The cost would be about 600*l.*, but it would be recouped by the charge for admission to some extent. He hoped that the Corporation and the City Guilds might find it possible to start a guarantee fund and he would do his best to see that their guarantee would not be called upon. The Lord Mayor said Sir Joseph Barnby's excellent suggestion should be laid before the Music Committee of the Corporation, and he had no doubt they would favourably consider its feasibility.

MASTER BUILDERS' ASSOCIATION.

THE thirty-second half-yearly meeting of the National Association of Master Builders of Great Britain was held at the North Stafford Railway Hotel, Stoke, Staffordshire.

Owing to the death of Mr. Robt. Dennett, the late president (who died on November 24 last), Mr. Stanley G. Bird was elected to the chair, and representatives were present from London, Liverpool, Manchester, Birmingham, Hull, Derby, Bradford, Bristol, Coventry, Crewe, Burslem, Walsall, Kidderminster, Bolton, Preston, Hanley, Ipswich, Fenton, Stoke, Longton, Leeds, Leicester, Newcastle, Northampton, Tunstall and Salford.

The report and accounts, as submitted by the Council for the past half-year, were adopted and ordered to be printed and circulated.

THE MOST PERFECT AND RELIABLE SYSTEM OF

VENTILATION AND HEATING FOR

SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

THE "ECLIPSE" PAINT REMOVER & CLEANSER.

The Best, Cheapest, and Most Effective in the World.

1a CRESCENT, MINORIES, LONDON, E.C.

The Chairman reported that the usual half-yearly statements of hours worked, state of trade and supply of labour in the principal towns of the United Kingdom had been issued to the local associations. With reference to the form of contract, the respective committees of the Royal Institute of British Architects and the Institute of Builders has decided to meet in conjunction with the solicitors appointed to arrange the clauses, with a view to settling any differences that may still remain on the legal points, so that the matter may be finally closed.

The present position of the new Employers' Liability Bill having been discussed, it was decided that as the matter at present stands, no useful action could be taken by the Association.

Mr. John Bowen, of Birmingham, the senior vice-president, was elected president for the ensuing year, and he thereupon took the chair.

The President in his opening speech referred to the severe loss the Association had sustained in the deaths of their late president, Mr. Robert Dennett, and their secretary, Mr. William Knox. He congratulated the Association on the state of its finances, which, under the able management of the treasurer, Mr. Jos. Stevenson Jones, had so steadily improved and were now in a very satisfactory condition, and also on the attendance at the meeting, which was the largest he ever remembered. Mr. T. F. Rider, London, and Mr. Jos. Stevenson Jones, Liverpool, were elected vice-presidents; and Mr. Stanley G. Bird, London, Mr. R. Neill, jun., Manchester, Mr. J. Howard Colls, London, and Mr. J. C. White, Liverpool, were elected hon. vice-presidents, Mr. C. W. Green, Liverpool, hon. treasurer, Mr. W. H. Smith, Northampton, hon. auditor, and the following gentlemen members of the Council:—

Mr. C. H. Barnsley, Birmingham; Mr. W. Sapcote, Birmingham; Mr. J. Henry Marsden, Bolton; Mr. Wm. Moulson, Bradford; Mr. W. Holdsworth, Bradford; Mr. A. Krauss, Bristol; Mr. W. Church, Bristol; Mr. Jos. Bell, Cambridge; Mr. John Walker, Derby; Mr. Thos. Bonnar, Edinburgh; Mr. R. Bennett, Glasgow; Mr. R. Beevers, Hull; Mr. C. Myers, Leeds; Mr. Banks Mawson, Leeds; Mr. Wm. Henry Close, Lincoln; Mr. Hy. E. Dallow, Liverpool; Mr. R. Stevenson Jones, Liverpool; Mr. Jno. Burt, London; Mr. Frank May, London; Mr. William Southern, Manchester; Alderman William Brown, Manchester; Mr. W. H. Smith, Northampton; Mr. Enoch Hind, Nottingham; Mr. James Bowden, Potteries and Newcastle; Mr. John Walmsley, Preston; and Mr. C. B. Holmes, Wigan.

Mr. J. A. S. Hassal, of Liverpool, who was a partner with the late secretary, was appointed secretary.

Various matters of special interest to the building trade were brought forward and discussed by the members, including the important bearing of the case of *Temperton v. Russell* and the Hull Unions, wherein it was decided that further financial support should be accorded. It was decided to hold the next half-yearly meeting at Bolton. A hearty vote of thanks to the Chairman for his able services concluded the meeting. Prior to the meeting a number of the members were conducted through the pottery works of Messrs. Minton, where they viewed the whole process of manufacture. The Potteries and Newcastle Master Builders' Association entertained the delegates at luncheon and tea.

BIRMINGHAM WATER-SUPPLY SCHEME.

THE Water Committee, in their report to the city Council with reference to the progress of the new water scheme, record that the total areas acquired, including the purchases reported to the Council on May 16, 1893, are as follows:—Ancient freeholds, 4,747 acres 0 roods 3 perches; common and exclusive rights, 14,683 acres 1 rood 17 perches; minerals or mining rights, 5,879 acres 2 roods 9 perches; manorial rights, 20,222 acres. The acquisition of the lands on the watershed has constituted the Corporation landlords of a number of farms and of extensive sheepstocks, which, by the custom of the country, are purchased with the freehold and are let to tenants at a rental of 5 per cent. on their value, the tenant keeping up the number of the flock. Arrangements have been made with Mr. Stephen W. Williams, of Rhayader, to act as local estate agent for the Corporation, and agreements have been entered into with the several tenants with respect to their several holdings and the stocks of sheep thereon. A contract has been entered into with the Cambrian Railways Company for the construction of the railway junction at Rhayader with the Corporation railway, and another contract has been entered into with Mr. Henry Lovatt, of Wolverhampton, for the construction of the railway itself as far as the Caban Dam, a distance of 2 miles 1,463 yards. The work is now well in hand, and it is hoped it will be completed some time in May next. Mr. Lovatt's contract, the amount of which is 11,793*l.* 9*s.* 8*d.*, comprises the earthwork and the laying of the permanent way, the sleepers, rails and small ironwork being provided by the Corporation.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON).—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

Without Drawer and Pigeon-holes on Top, £10 10*s.*

With regard to the aqueduct, notices to treat have been served in respect of a length of 17 miles 6 furlongs, and in many cases agreements have been entered into, and grants will be executed in due course. Arrangements are proceeding for obtaining immediate possession of the lands required for the construction of that section of the aqueduct in which are the Dolau and Knighton tunnels. The Dolau tunnel is about $4\frac{1}{2}$ miles long, and the Knighton tunnel about $2\frac{1}{2}$ miles. The contracts for these, it is hoped, will be let early in the year. The erection of the various temporary buildings required for the works at Caban Coch, such as stables, stores, carpenters and smiths' shops, &c., and the provision of machinery and fittings for working them, are well in hand. The erection of wooden buildings for the chief offices and houses for the staff is also being proceeded with. Arrangements have been made at Cwm Elan House (one of the two large houses on the estate purchased by the Corporation) to provide quarters for the assistant resident engineers. Nant-Gwylt, the other considerable house on the estate, is now occupied by Mr. Yourdi, the resident engineer, and arrangements have been made for the use of some of the rooms by members of the committee and officials, when visiting the works. The assistant engineers immediately required have all been appointed, also the chief accountant at the works, and some of the subordinate officials; while in Birmingham separate rooms at the offices in Broad Street have been set apart for the Elan work, and a staff of clerks appointed. The committee have given special attention to the system to be followed in keeping the accounts, so as to retain a proper supervision over the expenditure under the various heads. The housing of the men who will be required in the construction of the dams and the various works incidental thereto has required much consideration on the part of the committee. A suitable position for a navy settlement was found about half a mile distant on the Breconshire side of the river Elan. A lease of this land, with possession, has been obtained, and a wooden village, capable of accommodating a total population of 1,000, of whom probably 500 or more will be workers, is now being constructed there. It will be necessary later on, when the dams at Pen-y-Gareg and Craig-yr-Allt-Goch higher up the Elan are commenced, to build a second village for the workmen to be employed there. The village will be furnished with various conveniences for the employes, which have already been described in our columns, but which are formally set out in the report. In their report presented to the Council on May 16, 1893, the committee stated

that they had decided that the dams and the several reservoirs should be constructed by the Corporation themselves. The report proceeded to say, "This decision applies only to the dams; the works in connection with the railway and aqueduct will be tendered for and let to contractors in the usual way." The committee are still of the same opinion, and they have accordingly, as stated above, let the construction of the railway to a contractor, and are making arrangements for letting the portions of the aqueduct required to be immediately undertaken. There are, however, works in the valley itself connected with the dams, but strictly speaking outside them, as to which other considerations apply. These further works are, the tunnel from the Dol-y-Mynach reservoir on the Claerwen to Careg-ddu, the straining and valve towers, with certain road diversions and other subsidiary works. Mr. Mansergh has pointed out to the committee that it will be extremely inconvenient to have contractors' men working in the valley together with those directly under the control of the Corporation. Complications would be sure to arise as to the occupation of the villages, and in other ways. The committee will be able to pick the men and to enforce their own regulations with regard to the staff employed directly by themselves; but it would be impossible to exercise the same control over men employed by contractors. In addition to the works which it had been resolved to construct by administration, and those named above, Mr. Mansergh suggested that the Corporation should itself carry out the remaining works in the Elan Valley, that is, those adjacent to the village, viz. the Craig-y-Foel tunnel, the Elan conduit and the Caethon syphon. The considerations pointed out by Mr. Mansergh appeared to the committee to be convincing. The complication and inconvenience of several sets of workmen being employed in close proximity would be embarrassing in the extreme. Many of the arrangements of necessity made for such a staff as must be employed upon the dams will serve without extension for the further men necessary for the additional works proposed to be undertaken. The committee have, therefore, approved of Mr. Mansergh's proposal that all the works in the valley, including the laying of the conduit for about three miles from the village, shall be carried out by the workmen of the Corporation. The rain-gauge at Nant-Gwylt, kept by Mr. Lewis Lloyd for some years, and which was of service in making the necessary calculations in reference to the yield of the watershed, has been continued. The total rainfall registered for the year 1893 was 56.61 inches.

BUILDING IN VICTORIA, BRITISH COLUMBIA.

AT the annual meeting of the British Columbia Institute of Architects, Mr. R. B. Bayne, the senior vice-president, delivered an address on the buildings in Victoria. He said:—There are few completed buildings in Victoria of the past year that will call for much more than a passing notice. A departure from the general run is seen in the Temple building offices of Messrs. Ward & Co., a red brick and terra-cotta building that suffers from its close juxtaposition with its high neighbour and is dwarfed by it. I would more like to feel with reference to it that the well designed and treated terra-cotta detail was made for it, and not its façade for the detail. There is in some grilles to the ground floor windows some very good ironwork.

The Davie block is another new block I would make a passing reference to. Some of you will remember the *Times*' criticisms, and the criticisms on such criticisms that followed, and the amusing reference to "Dog Latin" styles—Romanesque. To one who has studied Romanesque art in its native country such references will certainly be amusing. The term Romanesque as applied out here is a misnomer in every sense. The Five Sisters block was so called by the same authority when the designs for it were first seen. I do not like the trabeated architecture affected here by some of our architects in the use of roughly hewn stone; it looks coarse, especially when used in a third and fourth storey; and the zinc shams, such as find place in this block, are I think to be condemned as untruthful and unconstructive. Better put up with plainer and simpler forms if economy has to be taken into account.

The new Protestant Orphans' Home, perched as it is on a hill, might have had a more effective outline than it has, and the money spent on brick decoration, which is not seen until close under the building, might have been devoted to carrying up the roof of the semicircular portions of the front.

It remains to be seen what the two new ward school buildings will be when completed. There is a breadth of treatment about the north ward building that shows up effectually at present, if it is not going to be crushed in appearance by the roof.

I think that I may include the Board of Trade new building in this year's completion. I do not like it in hardly a single feature. I do not like to see a building, standing as it does the end and flank to the sea approach to Victoria, as factory-like in its want of treatment as this is, and there are bits of

eccentricity in the façade that seem to be simple indulgences as freaks of design—objectless. It is an error, I think, to put at such a height as is done here minute detail, and in the crowning feature of the cornice grotesqueness culminates in the intersecting ornaments—of tin—at the corners. The middle stage is decidedly weak in design, and the plan seems to me more of a puzzle than an economical arrangement in its broken stairs and crooked passages, and is badly lighted in many places.

I was one of the Victoria members of our Association who attended last year's meeting in Vancouver, and in the company of your other vice-president made the most of our time in seeing that city—grown out of all recognition to me since taking it in my visit from India in the latter part of 1888. We paid considerable attention and went over some new buildings under construction—and this period of construction is, as you all know, the time when shams stand unveiled, and when true construction can be seen. We were both forcibly impressed with the difference in character of the work done in Victoria and that done in Vancouver. In Vancouver the buildings have a degree of solidity and truth in them that is sadly wanting in buildings in our capital city; ours are only too often what I look on as mere match-box constructions. I think our architects should kick against it. I know where the difficulty comes in. Architect A, inclined to go in for something better than mere lath-and-plaster partition walls, goes in for brick in accordance with good by-law construction and the credit of his profession; he would soon be put out of the field by Z, perhaps a needy self-styled architect, who, creeping in behind A, informs A's client that he, Z, can save at least 1,000 dols. of cost, said client being left entirely in the dark as to where and how the so-called saving comes in. To my mind A should carefully and thoroughly urge upon his client the question of stability and solidity as against "jerry work" and then, only on his client accepting responsibility, go in in opposition to Z, and fight him with his own weapons. I fear, though, that some of our clients, if reports are true, play you off one against the other and then take the cheapest; some of you sell your work Dutch auction bidding. In my three years of residence in Victoria I have seen such construction as I would not have ventured on, and yet in my work and practice in India I have done work in construction much bolder than my peers. The work I refer to as done in Victoria is not healthy work of construction, and I think it regrettable that in the capital of the province our architects should feel impelled to do such work—

WORKS, ROTHERHAM, Estab. 1854.

that such work should be looked on as a necessity. Men as owners of such work cannot, I think, have had them built as investments—only to sell—and even then false economy.

I was very much surprised only the other day to learn that the building inspector in Victoria has it in his power to alter a detail of construction in an architect's design. I should protest against such interference in the construction details in a competent architect's work; I mean one who may be reasonably credited with possessing sufficient knowledge of construction. I think that with good by-laws and a good inspector to see them honestly carried out, interference with an architect's construction would not be called for, and with good by-laws, not restrictive ones, and a resolute enforcement of them, such buildings as I have commented on would not be perpetrated.

It is within my province to-day to enter my protest against the recent action of the bricklayers of this city in their striking against the appointment of a clerk of works not belonging to their organisation, appointed for the municipal supervision of their work by the municipal authorities, and I anticipate that you are all of one mind. If such action and claim as they made were once acceded to, on such a plaint as was theirs, it would place us architects quite at their dictation.

Before we meet again, gentlemen, let us hope that things may improve with us all, and that we will be all busy men as now too many of us are idle men.

PUBLIC BUILDINGS IN CANADA.

To what extent and in what manner the Government is justified in encouraging by substantial aid the development of art depends, says Mr. G. F. Stalker in the *Canadian Architect*, upon a variety of circumstances. The possession, however, of galleries of art treasures and of fine buildings is an unmistakable evidence of national culture and progress, and no country having any pretension to greatness can afford to be without them. The balance-sheet of the finance minister is, after all, only a temporary index of national solvency. We must look into a different ledger for the indelible marks which show the onward or backward movement of the people. But the finance minister and every other minister can do a vast amount to foster and develop such thoughts and feelings as will ineffably impress themselves on the national character, and find expression in works of art which will be an indication to future generations of our standing as a people.

The ministers of the Crown in this country are the chosen leaders of the people, and they like to be spoken of as such. But they are in many instances only the followers of public sentiment. Ideas and schemes, which on the face of them have the stamp of necessity (sometimes of urgency), are put on one side because there has been no public demand for them, and so much valuable time is wasted in weary waiting for the great unwieldy mass of the people to meet together, formulate their ideas and submit their wishes to those in authority. All this seems just the reverse of what it ought to be. The wise leaders whose names have come down to us have been men who, being in advance of their time, have educated the people up to their ideas, and legislated and acted without the necessity of ever-recurring agitation and turmoil.

At present we want one or more of the ministers to strike out and take the lead in national art matters. The course is perfectly clear, and whoever steps into it will have the satisfaction of knowing that the laurels which he will gain will not be plucked from the brow of any of his contemporaries, nor from the chaplet of any of his predecessors.

It is, of course, freely admitted that there are difficulties in the way, the chief one being that we belong to a somewhat utilitarian race. The British people have never been too lavish in expending money on "mere works of art," and it has taken a long time to bring them to acknowledge the refining influences of the beautiful and pure in art upon the national character. But this is admitted now, and leading men throughout the empire lose no opportunity of impressing this truth upon us. In fact, if we look at the matter fairly, the encouragement of art by the national Government is really utilitarian in its effect. The national advancement and refinement are a *quid pro quo* for the national expenditure.

A slight indication of the way the wind is blowing was given during the last session of the Dominion Parliament. While the estimates were being discussed the Minister of Interior asked for a beggarly sum of one or two thousand dollars for the annual expenses of the National Gallery, when from an unexpected quarter a loud complaint was raised because the sum asked was not twenty or thirty thousand, which would have been as readily granted as the smaller sum. The fact that the complaint met with the general approval of the House is sufficient to show that the time has gone by when ministers need be afraid to ask for the expenditure of public money for art purposes, and it must be with satisfaction that every man of education and good sense will regard this fact.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street. Westminster, London.

But it must not be supposed, in speaking of art, that painting and sculpture only are referred to. Architects need not take a second place to their brothers of the brush and chisel in the beneficial effects on the public mind which are produced by their own branch of art. On the contrary, its place in the trio of the fine arts has always been and will ever be the first. And while as an art it exercises its refining and ennobling influences on the mind, it is practically interwoven with every phase of human existence.

On this account and because it would be impossible to conduct the business of the country without necessary and adequate building accommodation, architecture has received a fair amount of encouragement at the hands of the Government. No fault can be found with the different Governments so far as providing buildings when and where they have been found necessary. But the system which was adopted at the birth of the Dominion, and which was both necessary and suitable for that time, has nothing to recommend its continuance at the present. When the Dominion came into existence there were very few architects in the country, and comparatively no very great demand for them. Since then, however, the country has made rapid strides and has developed in every direction to an abnormal extent. With this growth has come the demand for a better class of building, and architects have come into the country and grown up in it to supply the demand; so that the larger cities particularly are well provided with buildings of a high order, and give unmistakable evidence that we have in our Dominion as capable a body of architects as are to be found in any other country at the present day.

The Government has no need, therefore, to restrict itself for its architecture to the abilities and services of one man, as was necessary and suitable thirty years ago. The system which we followed at Confederation was the best system for a young country; but we shall be doing a wise thing when we follow the example of Britain and other countries, and give opportunities to more than one architect to display their architectural abilities.

In quite recent times there have been a great many large public buildings erected in England, such as the Foreign Offices, the Law Courts, the Natural History Museum, the Admiralty Offices, &c. In every case the designs for these buildings were chosen either by public or limited competitions. The object the British Government had in view in these competitions was, not only to obtain the best designs, but to give to architects generally an incentive to put forth their best efforts

and to bring into prominence the talents of some who would otherwise have remained unknown.

It is impossible to over-estimate the benefits to the profession and to architecture in England which have resulted from these competitions. The influence of the designs that were submitted, and that remained for many weeks on public exhibition, has completely revolutionised architecture in England. At the beginning of the present century, and until about fifty years ago, architecture in England was at a very low ebb. Now there is no country in which buildings are erected on a grander scale, of more beautiful design, or where so much attention is given to architectural principles and detail.

To say that this has been brought about by the system of having competitive designs for Government and other buildings would be to claim a great deal too much. But no one can deny that this has been one of the most potent factors in producing the change. If such a system were to be adopted in Canada there is no doubt that the effect upon the architecture of the country would be beneficial, but it would give national encouragement to architecture without incurring any further charge upon the Dominion exchequer than is incurred now. The cost of maintaining the architect's department in connection with the Government amounts to more than 5 per cent. of the annual value of the buildings erected. The change would therefore involve no financial loss, but rather a gain to the country. It is not, however, for this reason that the question is here raised. Neither is it from any desire to find fault with the present Government architect, or to speak disparagingly of his ability. If the present system is to remain unchanged, it would be no easy matter to find, in the whole Dominion, a man better qualified for his position. But the circumstances which rendered such an office necessary no longer exist.

The buildings erected by the Dominion Government are chiefly post-offices, custom-houses, government offices and drill-halls, and though there is not much variety in the classes of buildings, the location and local requirements introduce elements sufficient to require considerable variety of treatment. But the most versatile architect becomes in the course of time liable to repeat himself; he may even become stereotyped in his versatility. We cannot therefore look for much progress in the architecture of our national buildings, when we continue through a long series of years to engage the services of only one man. But we are certainly running the risk of remaining at a standstill in this respect, and to do so is to retrograde.

But if it be a wise thing for the Government to secure by competition the best designs from the best architects in the country for our public buildings, it would be equally unwise to abolish absolutely the office of Government architect, and here again we might imitate the practice of the motherland. In all public buildings there are changes made as time goes on. And so, when any building has been completed according to the architect's design, the plans are deposited with the Government architect, who, with a sufficient staff of capable assistants, will look after any future changes which may be found necessary.

As already stated, the course is open for any minister of the Crown to distinguish himself by lifting our national art up to a higher level than it occupies now. And the foregoing is humbly submitted as an outline of a system which could easily be adopted in regard to our public buildings, and one which would give great satisfaction to the profession generally, as well as being of inestimable and lasting benefit to the country at large.

GLASGOW MUNICIPAL BUILDINGS.

At the last monthly meeting of the Glasgow Town Council, the sub-committee on the decoration of the banqueting-hall in the Municipal Buildings having submitted an interim report on the decoration of the banqueting-hall, the committee resolved to recommend that they should be authorised to visit and inspect, along with Mr. Leiper, some recent examples of the best decorative work in important public buildings, with a view to the preparation of such a scheme for the decoration of the banqueting-hall as the sub-committee could recommend to the Municipal Buildings Committee and to the Town Council.

Mr. Jack moved that the minute be not approved, but that it should be remitted for consideration.

Mr. W. F. Anderson moved that the paragraph be not approved. It seemed to him an extraordinary thing that having called in a man of skill he had practically admitted his inability to do the work. His opinion was that they were disgusting the ratepayers with deputations. He understood the proposal was that they should go to London, Paris, probably Rome, and possibly they would find the best example at Manchester on the way home.

Baillie Pettigrew considered that the best way would be to obtain competitive designs for the decoration.

Mr. Shearer said the committee had already had the benefit of the advice of the best artists in the city, and before any scheme was put before the Council the committee would have the advice of the best artists in Great Britain.

Mr. R. Anderson urged the importance of the committee obtaining such information as would enable them to have the highest possible artistic result.

Mr. Campbell urged his friends to withdraw their amendment. He looked with no favourable eye on the spending of large sums on deputations, but after careful investigation into the circumstances he was prepared to support the motion.

Mr. Osborne proposed that the number of the deputation be limited to three.

Treasurer Gray said they had every reason to be proud of the chambers, but there was no hurry for proceeding with the decoration of the banqueting-hall. It was not often used; they did not want to use it very often. The work of decoration could stand over for a year or two.

After some further conversation, Mr. Wallace agreed to limit the deputation to three members of the Council, with Mr. Leiper; and the amendments of Mr. Jack and Mr. Anderson were combined and put against the motion, when the minutes were approved by 33 to 25 votes.

LABOUR IN NEW SOUTH WALES.

THE Minister for Works in New South Wales has issued the following regulation with the object of excluding strangers from employment on public works:—"If it shall be represented to the Minister for Public Works at any time during the progress of the contract that an undue number of men are being employed thereon who have not been domiciled in this colony for six months previously to such employment, and such allegation be proved to his satisfaction, the Minister shall have power to call upon the contractor to discharge any or all such men, and on such direction being conveyed in writing to the contractor under the hand of the Under-Secretary for Public Works, the contractor shall discharge such men forthwith, and in the event of the contractor's non-compliance with any such direction, the Minister shall have power to declare such contract to be cancelled as if this stipulation had been expressly set out in the cancellation clause of the general conditions relating to the said contract."

TOWN FOG.

A LECTURE has been delivered under the auspices of the Leeds Corporation by Dr. J. B. Cohen, of the Yorkshire College, on "Town Fog." According to the *Leeds Mercury*, he said that before discussing the nature and effects of town fog, they would begin, as in the first lecture, in the case of carbonic acid, by seeking for its origin. Town fog was mist made white by nature, and painted any tint, from yellow to black, by her children. It was born of the air of particles of pure and transparent water, and contaminated by man with every imaginable abomination. How did this mist arise? It was water, vapour or steam, always present in the air in varying quantities, which, by a fall of temperature, suddenly appeared either as mist, or rain, snow, hail, or dew, according to the extent and rapidity of the cooling and the amount of water-vapour present in the air at the time. The amount of water-vapour in the air depended upon the temperature of the air, and this, no doubt, had been observed by all of them, because when the weather was warm and dry damp clothes would dry much sooner than in colder weather, or when the air was very full of moisture. There was one interesting and curious fact about the formation of fine particles of mist, or the larger particles we called rain-drops, or dew, namely, that the starting-point, the nucleus of each of these particles of water was a speck of dust—a speck so minute that it was generally invisible to the naked eye. Without dust there was no mist, or rain, or dew. It was solid matter which was the starting-point for the deposition of moisture. What would happen if air free from dust were saturated with moisture and the temperature fell? Water would be deposited, but only on solid objects. It would deposit on the ground and on our buildings; it would stream down the walls of our houses and soak the surface of the earth. Every solid thing out of doors would be wet, but no mist would appear and no rain would fall. Dust and vapour were, then, the parents of mist. What was the character and quantity of this mist? We knew that it was very plentiful in our houses. So far as we knew, it existed everywhere; but, of course, the quantity varied enormously. Some of the substances which were found in ordinary dust, which was sometimes allowed to accumulate in our houses, included spores, starch grains, crystals, meteoric iron like bits of soot, salt and bacteria. Much of this dust was so fine that it was invisible under ordinary circumstances. It was only when a beam of light in a darkened place, a ray of sun-

light in a room, a street lamp on a dark night, illuminated these little particles, so that they stood out against a darker background that we saw them—the so-called motes dancing in the beam. It was, in fact, these little particles which made the beam of light. Without the particles the path of the beam would be invisible. Although we breathed in this large amount of dust into our lungs, the greater part of that dust never came back again from our lungs, and there was little doubt that it must make a serious difference when it accumulated either in the wind-pipe or in the lungs. Referring to the weight and number of dust particles, which played such an important part in the production of fog, the lecturer noticed the experiments made by a distinguished physicist, John Aitken, to determine the number of dust particles in the air. By using a small vessel and dusty air largely diluted with air free from dust, he had succeeded in producing an apparatus in which the dew-drops or mist-drops were sufficiently small in numbers to be counted. After explaining the apparatus, Dr. Cohen said the total number of dust particles in the air varied from 8,000 to 100,000 in the cubic inch in the country, and in the towns they varied from 1,000,000 to 50,000,000 in the cubic inch. He was not satisfied with taking Mr. Aitken's results, and he borrowed the instrument to determine the number of dust particles in different parts of Leeds. At Woodhouse Moor he found the ratio of particles was over 32,000, at the Yorkshire College 52,000, and at the parish church churchyard over 200,000 in the cubic centimetre. Now, curiously enough, that corresponded with the centre of the town of Glasgow, with the wind blowing from the same direction—the north-west—which was 228,000, according to Mr. Aitken. There was one point to which he wanted to call their attention. He found that there were actually fewer dust particles in a flour mill, where the air was thick with dust, than there were in the parish church churchyard, but the size of the particles was very much greater, and that was the reason why the number was smaller. The probable reason was that in the process of cleaning the flour, the dust particles got electrified and coalesced. Alluding to the life-history of fog, the lecturer said that with a calm atmosphere, a high barometer and a fall of temperature a film of water would coat each, or an occasional little floating particle of dust, as it were, with an overcoat to keep it from the cold. A white fog covered the town. The particle of dust, now heavily weighted with its unwonted cloak of moisture, had its progress impeded, it hung or fell, but did not rise, and in its turn impeded the movement of the air.

Stained Cathedral Glass, and any other Interior Work.

Stagnation of the atmosphere was produced, especially as the wind was usually light with fog. What happened? An accumulation of combustive products occurred, namely, carbonic acid, sulphurous acid and soot, which, under ordinary circumstances, were rapidly dispersed. Our senses gave us abundant evidence of this in the case of soot and sulphurous acid. Our faces and clothes were soon begrimed, and our eyes and throats suffered from the irritating effects of the acid. If we assumed that dust particles were the cause of fog, then it naturally followed that the more dust particles there were in the air the thicker the fog; and, moreover, each particle of water floating as fog became coated with a film of sooty oil. The effect was that evaporation was retarded and the fog persisted longer than it would do were these particles composed of pure water only. He thought there could be no doubt in anybody's mind that fog had a very serious effect in increasing sickness and mortality, particularly the death-rate due to respiratory diseases. Dust was the mother of mist and rain. Whether our dusty town atmosphere brought us more mist or more rain it was difficult to say with any certainty. Whatever the facts might be, it was interesting to remember that dust was its own destroyer. Rain, snow and mist dragged it to the earth and so washed and purified the air. Were it not so, the greater part of the twenty tons of smoke daily sent into the air of Leeds would continue to float for ever in the ocean of air around us. That that atmospheric dirt was gradually delivered back to the earth was poor consolation to us who suffered from town fog. He had one suggestion to make. Those who had followed his lecture so far would, he was confident, agree with him as to the serious importance of this subject of town air, from the nature and extent of air pollution here in Leeds, its marked effect on the life of its citizens, especially of its working population and its effects on vegetation, and indirectly, therefore, on the possibility of purifying the atmosphere. Our medical officers, in their weekly or quarterly returns, usually included a certain amount of interesting and useful information about the weather, the temperature and the barometer readings. These weather statistics had their value in relation to epidemic and endemic disease. He did not wish to underrate them but how vastly more important was it for us to know the extent of our air pollution. And the matter carried still further weight from the fact that the weather was beyond our control, but the purity of our town atmosphere lay in our own hands. We wanted our experimental stations—our watch-towers within and outside the town—where the condition of the

atmosphere might be constantly tested, where, with every new progressive step in air purification, we might watch the effect on the atmosphere as well as on the health of the citizens. This need be no costly undertaking. Three or four intelligent lads of fifteen or sixteen, with a good Board school training, under the control of the city analyst or other competent chemist, could manipulate all the necessary apparatus, which in itself was simple and not costly.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 1323. Frederick William Baker, for "Improvements in casements."
- 1355. Alfred Standing, John Thomas Searle and Harry Watts, for "Improvements in smoke-consuming devices."
- 1366. James Rumgay, for "Improved apparatus for hanging doors and gates."
- 1422. Sampson Morley, for "Improvements in the construction of gulleys."
- 1437. William James Jordan, for "Improved double-hung window sashes and frames to facilitate cleaning."
- 1441. Thomas Cosham, for "An improved fire-escape."
- 1443. Samuel James Barford, for "Improvements in screw-down valves for water and other liquids, steam and gases."
- 1494. Franz Weiss, for "Improvements in fastenings for doors and the like."
- 1507. William Gibbon, jun., for "Raising sashes and lowering same without cords and weights."
- 1520. Richard Challenor and Herbert Walker, for "Improvements in hinges for step-ladders and the like."

COMPETITIONS OPEN.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

KIRKCALDY.—March 17.—Plans, &c., are invited for proposed Beveridge Public Hall, Free Library and Adam Smith Memorial Hall, &c. Mr. W. Roy Spears, Town Clerk.

MACHYNLLETH.—Feb. 28.—For Scheme of Water Supply and Sewerage. Premium of 40l. is offered. If the Engineer whose scheme is selected is appointed to superintend the execution of works, the premium merges into his commission. Mr. David Humphreys, Inspector of Nuisances, Machynlleth.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150l. and 50l., premium to merge. Mr. H. H. Hicknott, Town Clerk.

CONTRACTS OPEN.

ANTRIM.—March 5.—For Building Lunatic Asylum at Holywell. Mr. J. Lanyon, Architect, Northern Bank Chambers, Royal Avenue, Belfast.

ARMLEY.—Feb. 17.—For Alterations to Town Schools. Mr. C. F. Wilkinson, Architect, 35 Park Square, Leeds.

BATH.—Feb. 24.—For Execution of Work, Supply of Materials, &c., for One Year. Mr. C. R. Fortune, City Surveyor, 3 Terrace Walk, Bath.

BATHGATE, N.B.—For Building United Presbyterian Church. Mr. Thomas Dodds, Solicitor, Bathgate.

BATLEY CARR.—Feb. 16.—For Building Six Dwelling-houses. Messrs. P. Spencer & Son, Architects, Batley Carr.

BEDWAS.—Feb. 17.—For Building Board School and Additions to Bridge School. Mr. Evan Davies, Architect, Maesycwmmwr.

BILLINGSGATE.—Feb. 27.—For Construction of Underground Conveniences. The Engineer to the Commissioners of Sewers, Guildhall, E.C.

BIRKDALE.—Feb. 19.—For Supply of Glazed Pipes, Bricks, Cement, Broken Stone, Wrought and Cast-iron Work, &c. Mr. J. Fairbairn, Town Hall, Birkdale, Lancs.

BIRKENHEAD.—Feb. 19.—For Boundary and Retaining Walls, &c., for Refuse Destructor Site. Mr. C. Brownridge, Borough Engineer.

BRADFORD.—Feb. 19.—For Building Business Premises. Messrs. Empsall & Clarkson, Architects, Tyrrel Chambers, Bradford.

BRADFORD.—Feb. 19.—For Building Store and Two Houses. Messrs. Rycroft & Firth, Architects, Bank Buildings, Manchester Road, Bradford.

BUCKHURST HILL.—March 3.—For Tar-paving the Playgrounds and Footpaths at Boys' Board School. Mr. E. Egan, Architect, Chigwell.

BUCKHURST HILL.—March 3.—For Enlargement of the Boys' Board School. Mr. E. Egan, Architect, Chigwell.

BURSELEM.—Feb. 21.—Additions and Alterations at Chell Workhouse. Messrs. Ford & Slater and Mr. Walley, Joint Architects, Burslem.

CHICHESTER.—Feb. 21.—For Additions to Workhouse and Works of Drainage and Water Supply. Messrs. Inkpen & Swinburne, South Street, Chichester.

CHORLEY.—Feb. 20.—For Building Wesleyan Chapel. Mr. W. H. Dinsley, Architect, 20 High Street, Chorley.

CO. SUTHERLAND.—March 5.—For Construction of Three Harbours. Mr. James Barron, Engineer, 7 Union Terrace, Aberdeen.

CROYDON.—Feb. 20.—For Repair of Palmerston Road, Croydon, and Harrold Road, Upper Norwood. Mr. C. M. Elborough, 8 Park Street, Croydon.

ESSEX.—Feb. 16.—For Supply of Broken Granite for the Repair of Main Roads. Mr. Percy J. Sheldon, A.M.I.C.E., Chelmsford.

FAILSWORTH.—Feb. 28.—For Construction of Two Main Outfall Sewers, Pipe Sewers, &c. Messrs. Lomax & Lomax, Engineers, 29 Grosvenor Chambers, Deansgate, Manchester.

FAREHAM.—Feb. 26.—For Building Block for Fifty Children at County Lunatic Asylum. Mr. B. S. Jacobs, Architect, Lincoln's Inn Buildings, Hull, and 88 Bishopsgate Street, E.C.

FINSBURY PARK.—Feb. 21.—For Building Dressing-room and Shelter for Cricketers. The Architect, County Council, 13 Spring Gardens, S.W.

GODALMING.—Feb. 22.—For Construction of Contributory Drainage (Two Contracts). Mr. Samuel Welman, Surveyor, Church Street, Godalming.

GUILDFORD.—For Erection of Infirmary Buildings at Workhouse. Messrs. Peak & Lunn, 36 High Street, Guildford.

HENDON.—Feb. 19.—For Execution of Work and Supply of Materials for One Year. Mr. S. S. Grunley, The Boroughs, Hendon.

HORNSEY.—Feb. 23.—For Execution of Sewerage and Drainage Work, Street Watering and General Cartage Work, Concrete Footway Pavements, and the Supply of Stoneware Pipes and other Stoneware Goods, Broken Granite and other Road Materials, Broken Stone for Macadamising, Paving Granite and General Masons' Materials, Portland Cement, Grey Stone Lime, for One, Two, or Three Years. Mr. F. D. Askey, Clerk to Local Board, Southwood Lane, Highgate, N.

HYDE.—Feb. 26.—For Building Cemetery Chapels. Messrs. J. W. & R. F. Beaumont, Architects, 10 St. James Square, Manchester.

ISLINGTON.—Feb. 22.—For Supply and Fixing of a Hot-water or Steam Boiler at St. John's Road Workhouse. Mr. William Smith, Architect, 65 Chancery Lane, E.C.

ISLINGTON.—Feb. 22.—For Execution of Works and the Supply of Materials for One Year. Mr. W. F. Dewey, Vestry Hall, Upper Street, N.

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.

All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

CLACTON-ON-SEA.

TRADE NOTES.

THE Denton Holme Schools, Carlisle, are being warmed and ventilated by means of Shorland's patent Manchester stoves, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. FREDERICK JONES & CO., of Perren Street, Kentish Town, N.W., the patentees and manufacturers of the Patent British-made Silicate Cotton, have supplied and fixed a large quantity of the silicate cotton for the Queen's Hall, Langham Place, W. The wall was protected with this material for the purpose of preventing the transmission of sound to St. George's Hall, which adjoins it. The result was an unqualified success, and fully justified the expectations of the architect, Mr. Thos. E. Knightley.

BUILDING AND BUILDERS.

At the holding of the Kinning Park Dean of Guild Court, Provost Campbell, who presided, said that before proceeding with the ordinary business he desired to make a statement. As it appeared proprietors in the burgh did not generally understand that it was necessary to lodge plans with the surveyor and get the permission of the Dean of Guild Court before making alterations on their properties, he wished to draw their attention to the fact that by neglecting to do so, or by deviating from plans which had been sanctioned, they were not only rendering themselves liable to a penalty, but might have to take down their buildings or restore them to the state they were in previous to the alterations. It was also necessary that on completion of any new building, or alteration on an existing building, the owner or builder should give notice to the clerk of the Commission that the house or building, or any part of it, was ready for occupation, and that the surveyor, on being satisfied that the building was fit for occupation, should grant a certificate to that effect. Any owner or builder failing to give that notice, and permitting of occupation before the certificate had been obtained, would be liable to a penalty of 40s. for every day during which the occupation was continued.

At the meeting of the Montrose Town Council, the action of the public hall committee in purchasing the old property at the top of Bridge Street as a probable site for the proposed new hall was sanctioned, the price being 2,500l. The property is of Flemish design, with the gable-ends facing the street, and comprises the old hostelry known as Union Inn, and the house where the late Dr. Robert Brown, the botanist, was born.

BETTER church accommodation is required at Rugeley, and alternative suggestions are made for the alteration and enlargement of the existing parish church, for the restoration of the ancient parish church, of which only the tower and chancel remain, and the provision of an entirely new church in a more central position. The vicar, Rev. A. Moncrief, has subscribed 500l., and a sum of 3,000l. is available from a bequest by Miss Hopkins.

At a special meeting of the Commissioners of the burgh of Stirling it was resolved to erect public baths and washhouses, and a public covered bathing-place and public drying-grounds, at St. Ninian's Well Green.

At the monthly meeting of the Leamington Town Council a letter was read from Mr. C. A. Walker, contractor, Grimsby,

asking the Council to make him some compensation for the expenses incurred by him in tendering for a recent borough contract. Mr. Walker's contract was 70% lower than that which the Corporation accepted, and it was admitted that the only reason for the preference shown was that the successful contractor lived in Leamington. Mr. Purser moved that 5% be paid to Mr. Walker as compensation; but this was not seconded. Several members, however, expressed their conviction that the Council ought either to accept the lowest tender or to intimate in their advertisements that no outsider need apply.

OPERATIONS have been commenced for the demolition of the old Town House, Queensferry, one of the most interesting old structures in the burgh. This has been necessitated in consequence of the erection of a new Town Hall, which has been presented to the town by the Right Hon. the Earl of Rosebery.

It is proposed to build a theatre at Wakefield at an estimated cost of about 12,000£. The plans have been prepared by Mr. Frank Matcham.

It is estimated that it will cost nearly nine thousand pounds to repair the damage done to St. Mary's Church, Shrewsbury, by the fall during the late gale through the roof of the nave of about thirty feet of the lofty stone spire which was in course of repair. St. Mary's is the most beautiful of the ancient churches of Shrewsbury. An appeal for public subscriptions towards the restoration of the church is to be made.

VARIETIES.

THE *Glasgow Herald* says:—We understand that the erection of the basement floor of the new Art Galleries in Kelvin-grove Park is now being proceeded with. The discovery that the ground originally fixed upon as the site of the building was unsuitable, owing to the presence of a stratum of mud, delayed operations somewhat, but the new site recently granted by the Town Council has been found satisfactory in every respect, providing a complete foundation of solid rock as well as an admirable position for the building. The work will now proceed with all convenient speed.

It is stated that the Sussex Archaeological Society have received from the Earl of Chichester permission to excavate the galleries and chambers recently discovered beneath the castle at Hastings.

At the quarterly meeting of the Berwick Town Council the question of widening the old bridge spanning the Tweed at Berwick, at a cost of 4,000£, came up. Letters were read protesting against any alteration of the historic structure, and a petition signed by many, including Sir E. Burne-Jones, members of the Royal Academy, professors, Q.C.s, LL.D.s, authors and architects, stated that any alteration would destroy the character of this national inheritance. The Earl of Carlisle wrote that Berwick-upon-Tweed is the most interesting and picturesque town in Great Britain; to widen the bridge would be to ruin it. The subject was referred to a committee for consideration.

THE Hotel Victoria, Northumberland Avenue, opened less than seven years ago, very early established for itself a reputation as a comfortable and central stopping-place for visitors to London. The site of the hotel is one of the greatest historic interest, as any with antiquarian knowledge will be aware. It has just been purchased by the Gordon Hotels Company, and the fine tapestry decorations, which were executed by Mr. Boekbinder, have been touched up and restored.

THE Dewsbury and Heckmondwike Waterworks Board are about to construct two new reservoirs near Dunford Bridge. The estimated cost is 50,000£.

It has been decided to hold an autumn meeting of the Iron and Steel Institute at Brussels from September 4 to 7. The members of the Institute will thus have an opportunity of visiting the International Exhibition at Antwerp. Invitations have been received to visit Cockerill's steel works near Liège, Colonel North's cement works near Antwerp, and several other important establishments. The steel industry of Belgium is making rapid strides, and a visit to some of the new basic steel-works now being erected in that country will not fail to be an attraction to English ironmasters.

AT four o'clock on Tuesday last an extraordinary performance was given in the Imperial Theatre, Royal Aquarium, and we believe will be repeated daily at the same hour. It consisted of a lady dancing in a cage occupied by four lions. Mdlle. Walter claims to be the introducer and the first dancer of the serpentine dance performed in a den of lions. She has had a great success at the Gaiety and Eden Theatres, Paris. The lions, named Cæsar, Saida, Bobby and Lilian, are from three to four and a half years old, and are decidedly ferocious. At the Gaiety Theatre, Paris, they twice attacked their trainer, George Marcks, Cæsar on the last occasion leading the attack, and literally tearing Marcks' clothes to pieces, and he would

GOLD MEDALS—HUDDERSFIELD, 1883; LONDON, 1885.
SILVER MEDAL—PARIS, 1889.

have inevitably killed him had not Mdle. Walter fought the animal off. The attack was the more unexpected as the lion Caesar had been recently ill from sore throat, and had received the kindest treatment under Mdle. Walter's care. The show is one of the best to be seen in London. The Imperial Theatre, which is well lighted by a gas sunlight and gas all around, is suddenly placed in darkness, and the curtain rises amidst a blaze of light, disclosing four lions in an immense cage, occupying nearly the whole of the stage, with their trainer, who is engaged in subduing the most ferocious of the group. *Tableau 1.*—Mdle. Walter, handsomely attired, enters the cage, and amidst a blaze of light goes up to the lions, and after flourishing the scarf in the faces of the infuriated beasts, and going through a series of postures, implying an invocation to the lions, Mdle. Walter performs a scarf dance of incantation, during which the animals become subdued, and Mdle. Walter leaves the cage intact. *Tableau 2.*—The lady again enters the cage (this time in a silver and gold dress), and after going through a similar process of incantation to the lions, dances gracefully but with considerable animation a butterfly dance, during which mademoiselle flutters, as it were, butterfly wings in the faces of the lions. At first infuriated, the animals become calm, and allow the lady to leave the cage unmolested. *Tableau 3* is a serpentine dance, during which George Marcks, the trainer, is lost in the folds of the lady's dress, and for a time the lady is left apparently alone and at the mercy of the lions, and they becoming infuriated, Marcks reappears, and Mdle. Walter for the third time leaves the cage unhurt. *Tableaux 4.*—During Mdle. Walter's absence between the third and fourth tableaux George Marcks forces the lions through a series of hurdle-jumping, arousing the animals to a fury, amidst which, attired in a most resplendent silver dress, stated to have cost 4,000 francs, Mdle. Walter for the fourth time enters the cage, and with perfect *sang-froid* performs her celebrated serpentine dance, for which she is renowned. During this dance the lions become furious, and are kept at bay by George Marcks. At the conclusion of the dance, Marcks suddenly throws down his weapons of defence, and both Marcks and Mdle. Walter stand defenceless before the lions, who, strange to say, remain motionless before them, sheer force of courage and character emitted from the trainer's and Mdle. Walter's eyes keeping them from making an attack. With eyes rivetted on the lions, the lady and trainer retire from the cage. All Mdle. Walter's dresses are very handsome and exceedingly costly, and the

show has been brought from Paris at an enormous expense, where it has commanded as much as 200*l.* per week. The engagement of this costly exhibit is one of the most enterprising things that Mr. Ritchie has undertaken in connection with the Royal Aquarium.

ELECTRICAL.

At the half-yearly meeting of the Bristol Tramways Company Mr. W. Butler, chairman, said the directors could safely recommend the introduction of the overhead system of electrical traction between Old Meeting Street and Kingswood Hill. The accumulator system had been tried probably for the longest time at Birmingham, where one of the sections of the Central Company's system was worked in this way. As the result of a thorough test under the best possible conditions the system had been found not only excessive in cost, but uncertain and not suited to the requirements of tramway traction, so much so that the directors of the company had been compelled to propose its entire abandonment in favour of the overhead system. He was pleased to state that the authorities representing three-fourths of the length of route had already signified their unanimous approval of the Bristol company's proposals. This had been done after an inspection by the members of the local authorities of a similar installation at Walsall, Darlaston and Wednesbury.

At Derby, Mr. J. E. Stewart has been appointed engineer and manager of electric lighting works, with Mr. A. P. F. Moore as assistant engineer. It is recommended that the salary of the former shall be 260*l.* a year.

THE *Engineer* says corrosion of water-pipes and other underground furniture by the ground return of electric railways continues to be reported. The recent annual report of the Brooklyn Electrical Subway Commission states that discoveries of corroded water and gas pipes have been of late so numerous that there seems no escape from the conclusion that metal pipes of all kinds extending below the surface along the routes of the trolley cars are being in many places destroyed by the ground currents. The lead covering of the telephone cables in the subways is also suffering from corrosion.

THE *Standard's* Paris correspondent says:—Some very interesting experiments were made with M. Heslemann's electric locomotive on the railway between Havre and Benzeville. The representative of the *Temps*, who was present in the electric

train, with many notabilities, says they travelled from Benzeville to Havre at the rate of 80 kilometres an hour, which is not more than that of the ordinary fast train. The return journey from Havre to Benzeville, notwithstanding a steep gradient which had to be climbed, was effected at the speed of 100 kilometres an hour.

PROTECTION FROM FIRE IN LONDON.

THE fire brigade committee of the London County Council have prepared a report on the necessity for additional protection from fire in the Metropolis. The committee explain that since the governing authority was entrusted to the Council there has been an increase of 1 fire-engine station, 53 fire-escape stations, 23 hose-cart stations, 3 hose and ladder truck stations and 2 permanent street stations, one raft steam fire-engine, 67 fire-escapes, including police ladders, 1 hose tender and fire-escape, 24 hose-carts and hose-rafts, 5 hose and ladder trucks, and 2 tugs, 2 rafts with steam-engines, 205 fire-alarms, 9,009 hydrants fixed or ordered, while the staff has been increased by 9 officers, 117 firemen, 7 coachmen and 1 pilot. They also point out that another fire-engine station (at New Cross) is now in course of construction; that new stations have been built in place of old ones at Wandsworth and Brompton, and that the Council has authorised the erection of a new station in substitution of that at Fulham, the enlargement of those at Clerkenwell, Kennington, Battersea and Mile End, and the erection of a building for the accommodation of a staff attached to the river station at Rotherhithe.

It has been recommended by the chief officer that instead of largely increasing the number of the fire-engine stations with the usual staff of an officer, five or six firemen and a pair of horses, it would be better to rely on an augmentation of the number of men stationed at comparatively short distances apart with hose-carts and fire-engines. He suggested that new stations should be built in place of the Notting Hill, Paddington, Islington, Portland Road, Shoreditch and Lewisham stations; that the proposal to establish a station near the Law Courts should be abandoned, that the Watling Street Station should be given up, and that in place of these two a large station should be built at the eastern end of the Victoria Embankment, close to Fleet Street and Blackfriars Bridge; and that the river station at Shadwell, which is too near the floating station

at Rotherhithe, should be removed further eastward. After careful consideration the committee endorsed all the recommendations except that relating to the Notting Hill station, and the decision had been reported to and approved by the Council as far as the stations in the City, and at Paddington, Islington, Shoreditch and Lewisham are concerned. They had, however, not yet been able to submit a recommendation with respect to the Portland Road station, or the river station at Shadwell. The chief officer also recommended the establishment of a river station at Battersea, of three or four fire-engine stations, and about thirty sub-stations and street stations, an increase of about thirty in number of hose-cart stations, and about ninety fire-escape stations and, further, the placing of steam fire-engines at some existing stations unprovided with them. The Council has recently authorised the addition, consequent on the establishment of the Dulwich and New Cross fire-engine stations, of one street station, three escape stations, and two hose-cart stations. The committee recommend the establishment of an additional station at Battersea Rise, additional fire-engine stations at Shepherd's Bush, near St. John's Park, Blackheath, and that on the completion of the building the existing station at Tranquil Vale, Blackheath, be utilised as a sub-station at Perryvale, at Streatham, and at Battersea Rise and that a sub-station or a street station be established in each of the following localities:—North End Road, Fulham; High Road, Kilburn; West End Lane, Hampstead; King's Cross; Caledonian Road (about the centre); New North Road, Islington; Piccadilly Circus; Strand (near the Law Courts); Gloucester Road, Regent's Park; St. John's Park, Holloway Road; High Street, Homerton; the Triangle, Mare Street, Hackney; Burdett Road, Limehouse; Millwall Dock entrance; North Woolwich; Eltham; Lee Green; Scandinavian Church, Rotherhithe (near); Camberwell New Road; Walworth Road; Herne Hill; Brixton Hill; Priory Road, Lambeth; Battersea Park Road. On the establishment of a sub-station or a street station at Piccadilly Circus, the existing fire-escape stations in Piccadilly and Golden Square will be given up; on the establishment of a sub-station or a street-station in the Strand, near the Law Courts, the existing hose-cart station at St. Dunstan's Church, Fleet Street, close to Chancery Lane, will be given up; on the completion of the new Lewisham fire-engine station the existing station at Rushey Green, Catford, will be utilised as a sub-station. The committee share the chief officer's opinion that men should be on duty during the day at all street stations,

and they recommend this with respect to Spa Road, Bermondsey, and Vauxhall Cross street stations, and that the stations be in each case placed in telephonic communication with the nearest fire-engine station, and that the fire-alarms be thereupon dispensed with.

The committee submit a rough estimate of the cost of the scheme. They put stations (ground and buildings) at 81,000*l.*, and appliances and gear at 11,570*l.*, making a capital outlay of 92,570*l.* Maintenance figures in the estimate at 24,300*l.*, being 19,250*l.* for staff (pay, clothing and medical attendance), and 5,050*l.* for other charges. The committee point out that the annual amount to be raised to provide for the redemption of capital and the payment of interest at 3 per cent. would be 4,751*l.* 18*s.*, which, together with the additional annual expenditure for maintenance, is equal to a rate of less than a farthing in the pound. The committee are satisfied that the needs of the large area within the Council's jurisdiction require a substantial augmentation of the staff and appliances of the brigade, and, as they believe that the ratepayers of London would willingly bear the cost which such increase would involve, they submit the recommendations, assured that the Council will give to them that consideration which the importance of the subject demands.

THE L.C.C. AND ITS WORKS COMMITTEE.

THE apostles of the direct labour doctrine on the London County Council, says the *Local Government Journal*, cannot be congratulated on the sorry figure which they cut by the first and last tabulated statement of results of doing away with contracting. The details of fourteen works have been given with a great flourish of trumpets, after we had, week in and week out, repeatedly challenged the committee to produce their accounts. It was shown on Tuesday how, on estimates amounting to 20,900*l.*, over 2,000*l.* had been saved. The smartest stroke of business was averred to be in respect to foundations for certain cottages, a work for which the contractor had, according to the Council, asked too much. The committee claimed to have saved nearly 2,000*l.* on the estimate, but Mr. Lyon, their chairman, hastily knocked away this, their only leg to stand on, by stating that, after all, the work was not completed, and the cost was not at present ascertained. Thus it comes about that the return was wholly misleading, and that the claim to have saved money on the estimates fades into nothingness, especially beside the fact that, on the committee's

own showing, the erection of a lodge and convenience at Plumstead Common cost 24 per cent. over the estimate.

Even supposing that it were possible to congratulate the committee on its work, we could not do so on its tabulated statement, inasmuch as it is erroneous from beginning to end. It is impossible to place faith in any of the figures when the most important are avowed to be incorrect, and ought never to have been placed on the table. The publication of these financial blunders has, however, been received with great joy by the faithful, not one of whom had the courage to state that the figures were merely approximate and could not be trusted. But it would be interesting to know why they were ever placed in the column; was it to gloss over extravagant expenditure and to prove the contractor to be an extortionist, or was it to give an untruth a good start and so make it impossible for the real truth to catch it up? Surely some one must have known that the work was not completed. It certainly does not look like an honest statement when the only favourable item of any importance, and the only one which stands in competition with the contractors, is admitted by the chairman of the committee to be wrong. For its own protection the Council framed a series of regulations for the committee, providing that, after a job had been measured up, the receipts and vouchers for all costs should be placed before the comptroller, whose duty it would be to check them, and, finally, to pass them on to the finance committee. This regulation the committee have ignored altogether; and, further, they have long ago completed jobs which do not appear in the statement, nor have any particulars yet been given. The committee have totally ignored all interest on capital expended in purchasing the wharf, and the enormous quantity of plant and timber which is now stored at the wharf. Some of the jobs, too, have occupied a longer period than would have been occupied by a contractor; while, if we come to Westminster Bridge, which was painted to provide work for the unemployed, and upon which five coats of paint were put, we find a stupid waste of money. However much the Council may desire to do all they can for the workless, they have no right to incur wanton expenditure by undertaking such work as painting when climatic conditions are all against it. At the same time, we are bound to say that the work was well done—probably better than it ever had been before. But it could be equally as well done in the spring at a great deal less cost, as, owing to the dirty and windy weather, an extra coat of paint was put on the parapets.

The committee's best friends and warmest advocates are

bound to confess the utter inability of the Council to undertake special skilled work. The establishment charge of 5 per cent. which is put down is held by those best competent to judge as being very much below the mark; in fact, at least 50 per cent. below what it should be. The column relating to the use and waste of plant is wholly misleading, and gives no accurate notion of what plant has been wasted, what has depreciated in value, and what the value of it was which was used. The Council should not delude itself into the notion that every summer will be like the last. They will find that in constructing the Fleet storm-sewer, that if it should be a wet summer there will be a heavy charge for pumping, a charge which was absent when the York Road sewer was constructed, on account of the dry season. Another friend of the committee who has, in season and out of season, supported the principle of direct labour, declares his belief as a member of the Council that there were some small works which the contractor could do better than the Council; while another, who is a practical builder himself, and an enthusiast of the principle of direct labour wages, contends that the Council must leave all special skilled work severely alone. The Vice-chairman of the committee admits that the committee were asked to send in prices for work before they were ready to do so; hence the high prices. Mr. Alderman Taylor confesses that, so eager were the advocates of direct labour to put the system in force, that they compelled the committee to do their joinery by hand, a process which entailed a great loss compared with a contractor's price, while an enormous sum has been wasted in buying and stacking timber for seasoning, a waste equal to 5% and 10% per standard, which need not have occurred if the system had been initiated with cautiousness and care.

There is only one method in which we can get to understand whether the ratepayers are getting a *quid pro quo* for their money. Let the works committee, compete in every job with contractors, and if the latter beat them we may surely give up the works department as a white elephant which was conceived in ignorance and born of fatuous folly, for, assuming that all establishment charges are taken into account, and that even the proportionate interest on capital is allowed, the works committee have not, like the contractor, to earn a living, so that in every case they should be at least 20 per cent. below the contractor. But the works committee are too wily to put their offspring into honest competition, especially after the Parliament Fields refreshment-house revelation. It would prove too much and be distasteful to labour.

BRITANNIA RECEIVING THE HOMAGE OF THE NATIONS.

THE NEW SUBTERRANEAN GOODS STATION.

NONE of the great railways, on their first introduction into the metropolis, had originally, says the *Standard*, made adequate provision for the wonderful increase of goods traffic that has since been developed. The Great Northern, however, were not wanting in forethought, and still possess some further room for expansion. The competition of other lines also influences their action, and necessitates additional accommodation for the delivery of goods inwards and the reception of goods outwards on a scale not inferior to that provided by their rivals. About fifteen years ago they obtained a footing in Farringdon Street, and the immense warehouse in Charles Street abutting laterally on the Farringdon Road has been gradually expanding ever since. When the London, Chatham and Dover Railway burrowed out the ground from one side to run their passenger trains alongside those of the Metropolitan Circle system, the Great Northern dug out the bank on the other side of the cutting, and added an acre and a quarter of underground works to their Charles Street Station, extending up to the familiar chimney at the Vine Street bridge leading to Clerkenwell. For some years there has been a vast and more or less open space extending from Charles Street south to Charterhouse Street. Part of it has been built over by the new markets; and contractors' and other works have of late been gradually obscuring the rest from view. This area of 3½ acres has been excavated to a depth of some 25 feet below the street level, and the ground abutting on to Snow Hill is now one uninterrupted subterranean station, with numerous lines of railways and sidings, platforms, cranes, capstans, lifts and appliances, with cart roads meandering in all directions for the conveyance inwards and outwards of goods. The whole of this has been almost

entirely roofed over by iron roofs, which form the floors of the superstructures of the edifices erected on this basis at the old ground level. All these operations, too, have been executed without stoppage of the public vehicular thoroughfares. Of the magnitude of some of the undertakings, the steel bridge which supports Charterhouse Street is one example, being 150 feet in length by 60 feet in breadth. Under Charles Street is another steel bridge 60 feet long by 40 feet. From a subterranean platform under the new vegetable market, alongside which the railway trucks are run, two hydraulic hoists will carry up on suitable barrows the packages of fruit and vegetables as they arrive. In the new subterranean station there are five capacious platforms—two nearly 200 feet in length—with appropriate sidings and turntables adjoining. The whole floor of the station is paved with granite. Access to this is provided by two inclined roadways—one from Charles Street, on the north-west, and one from Snow Hill on the south. All the cranes and machines are worked by hydraulic power, the water being delivered for work at 700 lbs. pressure to the square inch. The old hydraulic station at Vine Street is being enlarged to treble its present capacity; and shortly the whole underground area of five acres in extent will be illuminated by electric lights, served by the company's extensive generating station at Holloway.

There are novelties in the construction of this underground station that are well worthy of notice from the engineering point of observation. Hitherto the stanchions or supporting pillars intended to carry spacious superstructures and ponderous loads of goods stored in them have been universally formed of plate-iron or steel, rivetted together as a square pillar, into the interior of which no eye could peer, and consequently no certainty exists as to the actual serviceable condition of the pillar. By a very ingenious device the stanchions in the new station are in the form of two double T girders crossed, and in this way the whole of the iron surfaces are exposed to examination, and can be easily scraped, painted and preserved. Another very noticeable feature is the way in which the ends of all the horizontal roof and other girders are let into the tops of the stanchions and rivetted therein at right angles to each other, so that the whole of the immense overhead network of girders is tightly and securely combined into one substantial whole. The bases of the steel stanchions, which are splayed out at the bottom to about 4 feet square, have a firm resting on concrete and brick foundations, which are 12 feet square where they repose on the solid ground below. But the wonders

of the new Farringdon Street works do not end underground. The effort to give ground-level accommodation to the commercial traffic has never been so fully attempted in any other station. Carters do not like working their horses and loads on inclines. The façade of the new warehouses and offices in progress of erection will face the former warehouse of the Great Northern and the Metropolitan Circle Railway Station in Charles Street. It will have entrances for carts from the roadway, and its remarkable feature is that all these will be served from fourteen bays, in direction north and south, disposed on each side of a "traverser" way running east and west. At one end, the eastern, are two hydraulic lifts, each of which will lift a railway goods truck from the subterranean station to the ground-level station above it. The "traverser" is a platform on wheels worked to and fro in the direction of a line of rails on each side. Thus, when a goods truck some 20 feet long and 8 feet or 10 feet wide is brought up by the hoist, it is run off from it in the direction of its length on to the "traverser," which is then worked forward to the particular bay where it is wanted for unloading or loading. It is then run off the "traverser" on to the platform at the bay referred to. The "traverser" then returns to its station by the lift and acquires another truck, which it moves off with to another particular bay. It is in this way that the trucks can be sorted, moved into place, and taken away again in the most simple and expeditious manner. The drawings of the new façade show a general front in buff and red bricks, with one line of windows above the door entrances; but the erection has not yet reached to the latter elevation. The new underground station has already been partially brought into use, and seems likely to be accepted as a great public convenience. It will save the cartage from Charles Street to King's Cross, and will gain custom from Tooley Street, Bermondsey, Southwark, and all the goods districts on the south side of the Thames, as well as serve the Aldgate and Leadenhall Markets. The merchants of the busy parts in Cannon Street and Aldersgate, and their surroundings, will benefit largely by the change, and the local meat and vegetable markets will gain increased supplies and more expeditious deliveries. The brick boundary wall on the eastern side of the site, abutting against Farringdon Road, will for the present remain, and any further advance on that side is postponed.

The new works have been designed by Mr. R. Johnson, the engineer in chief of the Great Northern Railway, and their execution has been under the direction of Mr. John Tunstall.

ELECTRIC LIGHTING OF LONDON.

ON the 9th inst. Mr. A. Siemens presided over an ordinary general meeting of the members of the Institution of Electrical Engineers, when Major-General C. E. Webber read a paper on "Some Notes on the Electric Lighting of the City of London." There was a large attendance. The lecturer traced the history of the initiation of the light in the City, and claimed that the City of London took the lead in making a practical experiment on a large scale. Much encouragement was afforded by that experiment, but although the City was one of the earliest areas upon which the electric light manufacturing companies set their eyes, the general tenor of the recommendations in 1883 was that the Commissioners ought to obtain their own provisional order of license, and this was done. No public body probably had taken more pains than the City Commissioners to weigh carefully the pros and cons bearing on the question of their becoming themselves the undertakers for supplying electricity, and but for the host of offers, merely speculative or otherwise, continually sent in to them, they would in the end have decided on raising the necessary capital to do the work themselves. There was no doubt that the ratepayers of the City would now be in quite as good a position if no provisional orders had been granted. The Commissioners were roused finally to activity in January 1889 by the Electric Lighting Act of 1888, and the City having been divided into three districts for the purpose of the contracts, tenders were publicly called for. The lecturer then described the results of the advertisements, the difficulties which the accepted contractors had to meet, and the processes which they adopted, and in conclusion he paid a cordial testimony to the staff which carried out the work.

REGISTRATION OF PLUMBERS.

AT the fourth annual public meeting of the Leeds District Council for the National Registration of Plumbers, presided over by the Mayor of Leeds, Mr. W. H. Bishop (past master of the Worshipful Company of Plumbers, London), in proposing the election of the members of the Council for the year 1894-95, said:—

Right Worshipful Mayor, Councillors and Gentlemen,—I have the honour of submitting to you the resolution by which the district council for Leeds will receive election for the year.

As you are aware, the constitution of all our councils and committees is—one-third master plumbers, one-third operative plumbers, and one-third the representatives who are charged with the interests of the general public. It is, I believe, a unique instance of confidence in the common appreciation of a movement by which the public are to be protected, that the masters and operatives in the craft invite the qualified representatives of that public to share in the control of the measures by which their trade organisation is governed. If the masters had any separate purposes of their own, the operatives are present to check such a tendency. If both sections of the craft had any exclusive trade interests to serve, the public representatives would no longer feel any interest in the work. The harmonious relations of the three sections of the Council indicate the bond by which all are tied—the public welfare. And what, gentlemen, is the result? This is your fourth annual meeting, and each year tells of steady progress. I see the same names as supporters of the organisation, while in all important details you increase in importance. Your students show better results. The Right Worshipful Mayor spoke of your friends and of your flourishing condition. So far as the schools are concerned, the ability of the teacher is evidenced in the number of prize-takers and the quality of their attainments. The devotion of the teacher needs no praise at my hands. He is a volunteer, and a debt of deep gratitude, in addition to a pecuniary acknowledgment which he deserves, is ours to him. It is a source of great satisfaction to me, on behalf of the Worshipful Company of Plumbers which I represent, to welcome that one of your students who, on passing in honours, becomes entitled to the honorary freedom of the Company. Such accessions to our members carry with them evidence that good is being done, and that the roots as well as the branches of what is more than a City Company are extending all over the country.

In your examinations of candidates for registration I observe, by the first report, that you had remitted fifteen for examination, three of whom passed. In your succeeding reports I find that of those remitted for examination, none passed. These facts show, gentlemen, that your Council has performed its duty with as much care as discretion. If you had exercised less care or had been influenced by any external considerations, the result could not have been so completely satisfactory. It would be a mistake to suppose that the small number of "passes" is in any sense a reflection upon the severity of the examinations. It simply indicates that the

subjects sent for examination were men whose qualifications had not been proved, and the result of the examinations justified the Council in submitting the candidates to that ordeal. The health and lives of the community are, to a large extent, in the hands of the plumbers, and it is the duty of the Council to ascertain that the holder of a certificate is a competent craftsman. You inculcated the true teaching on this subject in your first report, when you said:—"It is the duty of each registered plumber to uphold the honour of his craft by taking an honest pride in careful workmanship," and the report adopted at your meeting to-day is an earnest of your successful efforts.

Your president, Mr. J. Wreghitt Cannon, has spoken of the museum of plumbing proposed to be established. There is deep philosophy in his remark that "we learn more from our failures than from our successes." It is best, as he proposes, to exhibit examples of bad plumbing. Those who see bad work will go home wiser and better instructed than when they came out, and will look after and watch the work done in their own homes, to their own advantage and to the satisfaction of the plumber, who will realise that good work is appreciated.

Some of those who have addressed you this day have spoken of bad plumbing and of bad architect's work. It is well to remind you that the builder has much to do with the aspersions levelled alike at architects and plumbers. In many cases an architect is not consulted, and the plumber is simply told what to do. The development of the registration movement will, I hope, alter this. The plumber should have control of the plumber's work, and I hope the day will come when he may safely count upon public support, and refuse to do what he knows to be work calculated to render a house unsafe to the health of those who may dwell in it.

I have a few words to add relative to the Plumbers' Registration Bill, which, as you know, failed to pass this session. Referred to the Standing Committee on Trade, it met with insufficient attention. No witnesses were examined, and the statements made raised an unfair prejudice against a measure by which the plumbers, masters and men, in a voluntary organisation ask protection from Parliament in the exercise of their own efforts to protect the public from injurious plumbing work. When the Bill passes everybody will be free, as he is now, to engage unregistered men. But those who are voluntarily registered will have legal control of those who are members of their own organisation, and will prevent unauthorised workmen from pirating their name and title.

There is in connection with your craft power residing with the county councils to raise and apply money to technical instruction. I venture to commend to you to make clear to the county councils that plumbers need special instruction which cannot be acquired in classes common to all students. This should be an easy task, and it is demonstrable that money applied to the special teaching required by plumbing students will return results to the community exceeding that applied to other trades. A good plumber can prevent disease in many matters that relate to his craft, and if he contribute to the healthiness of home he will repay all the money expended in his training.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

STREET CAR PROPULSION.

THE Metropolitan Traction Company, of New York, have offered a prize of 50,000 dols. to any inventor who will by March 1 submit a system of street car propulsion, equally efficient with a trolley or cable system. The selection is left to the Railroad Commissioners. In their communication the company say:—

During the past year we have made a very successful test of the cable on Broadway. The net result of this experiment is that, although the times are very dull, there being a falling-off from 10 to 15 per cent. on all local traffic, there is a uniform gain on this line, and before the year ends the indications are that, in comparison with the previous year, when the road was operated with horses, the cable road will show a gain in traffic of not less than 25 per cent. and a saving in the expense of operation of more than 20 per cent. This total gain to the company of 45 per cent. is a large item to consider, and there need be no cause for wonder why the large prize of 50,000 dols. has been offered to the inventor who will present to the Railroad Commission the best system of motive power other than the trolley. Although little appears in the correspondence to indicate that any particular kind of power is desired by the company, yet it is understood that any particular storage battery system which can be operated as cheaply and as successfully as the overhead system is not sought after. The proposition which the company makes to the Railroad Commission is set forth in the following extract from the correspondence:—

1. We will set aside the sum of 50,000 dols. to be awarded as a prize to any person who shall before March 1, 1894, submit to your honourable board an actual working system of motive power for street railway cars demonstrated to be superior or equal to the overhead trolley.

2. The qualities necessary to meet this requirement shall be left to your decision, but with the present state of art a system to win the award must necessarily approximate the trolley as a standard of economy in operation, but should be without the features objectionable to the public that are in it.

3. We shall exact no rights in the invention in return for the 50,000 dols., and shall have nothing whatever to do with the making of the award, further than to pay any expenses which your honourable board may deem it necessary or wise to incur, either in the employment of experts, the giving of hear-

ings or the conduct of experiments, this in order that no effort may be spared to achieve the desired result.

We desire, however, to suggest to your honourable board that any invention worth considering will ordinarily have inspired sufficient confidence in an inventor and his friends to warrant them in paying the expense of an experiment, provided facilities are furnished therefor. If we are asked to pay the expense of experimental forms of traction not sanctioned at present by any general use, we should desire to be consulted as a necessary precaution against visionary and unjustifiable expenditure by our company.

The advantages which would accrue to an inventor from the finding of your board in his favour, and the adoption of his system by our company would be so great that we do not consider it necessary to stipulate terms for its use on our lines, especially in view of the fact that, in the event of exorbitant demands, it would remain in your power to take such action as in your judgment would be necessary for the protection of the public. As the proposal itself plainly indicates, our faith in the capacity, judgment and fairness of your board is such that we feel warranted in practically placing the whole matter in your hands and leaving the decision of any questions that may arise to your discretion.

Permit us to say, in conclusion, that in submitting this proposition we make no pretence of disinterestedness. Our motives, while not altogether selfish, are those of business. We do feel justified, however, in suggesting that in this matter at least our interests are identical with those of the city.

ELECTRICAL ENGINEERING.

At the meeting of the Northern Society of Electrical Engineers held at the Palatine Hotel, Manchester, Mr. C. E. Preece in the chair, Mr. John Hesketh read a paper descriptive of the plant and system adopted for the electrical installation at Blackpool. He stated that so far back as the year 1879 Blackpool first tried electric lighting by means of Siemens's arc lamps, each run from a separate dynamo. The character of the work then done was indicated by the fact that the original dynamos and lamps were burning until August last. The demand for a more general application of electricity to both public and private purposes called for an extension of the scheme, and the Blackpool Electric Lighting Order, 1890,

granted powers to the Corporation to lay down works for the supply of electricity from a central station. The town was long and narrow, and it was therefore decided to adopt the high-tension system. The building in which the plant was erected was on land which furnished ample room for extension. Details were given with regard to the boilers, engines and dynamos. The distribution, it was explained, was done by means of cables insulated by vulcanised indiarubber. These were drawn into 3-inch cast-iron pipes, as many as six cables being drawn into one pipe. The furthest point at which a supply was given was two miles distant from the station. The street boxes were of iron or brick, with cast-iron covers, and as the high tides came so frequently over the promenade it was useless to try to keep the conduit dry. No difficulty was experienced, however, in working with the cables under water. The public arc lamps were erected on pillars of a design which was a modification of that in use in the main thoroughfares of Paris. The lamps were burning steadily and well, despite the high winds recently experienced. Transformers were placed wherever possible to feed three or four consumers, but in many instances this was not possible and a separate transformer for each consumer was fixed. A considerable extension of the works was at present in contemplation.

THE GERMS OF THE AIR.

A LECTURE was delivered at the Leeds City Fine Art Gallery by Dr. Julius B. Cohen, of the Yorkshire College, on "The Germs of the Air." The lecturer began by saying, says the *Leeds Mercury*, that until the beginning of the present century physical science directed the minds of philosophers mainly towards the study of the infinitely great—the discovery of new worlds in space, the study of universal gravitation, and the measurement of the velocity of light. The present century had illumined a new path in the Dark Unknown. The science of to-day was essentially the science of the infinitely small. Dalton's atomic theory—a theory of the invisible atomic structure of matter—was the foundation of modern chemistry and physics. The germ theory of disease—a theory which involved the existence of the microscopic living matter dwelling within and around us—was the basis of modern pathology and surgery. Having explained that the discovery of those living particles—which were so small that it was probable that many

of them defied the scrutiny of the most perfect microscope—originated in the study of the process of fermentation, Dr. Cohen referred to the work of Pasteur in this field of inquiry, remarking that the researches of Pasteur formed one of the noblest services man had rendered to his country. By means of slides the lecturer exhibited on a screen a number of drawings illustrating the observations of M. Miguel in the observatory of Mont Souris, on the outskirts of Paris, as to the composition of the air of that city. These experiments, he said, were directed to determining the number of vegetable spores, fungi and microbes in the air in various places and at various seasons of the year. Miguel had determined the amount of vegetable matter and microbes in the streets, bedrooms and living-rooms of Paris and the environs. One was struck with the great rarity of those minute beings, and the difficulty of distinguishing them was increased by the fact that they appeared to vary in shape with the nutriment in the matter on which they grew. It was certain that at least a few produced disease, and it was equally certain that a large number, when inoculated into animals, were harmless. That those harmless ones served a useful purpose in carrying on putrefactive change—acting as scavengers for the world's refuse—seemed not unlikely, but the subject was still in its infancy, and one upon which, no doubt, fresh light would fall as bacteriological research progressed. The number did not seem to vary proportionately with change of temperature, but if they compared the rainfall with the number of microbes, they saw at once a rapid diminution. The rain evidently carried them down to the earth. But they were far from being destroyed. The moisture seemed to assist reproduction, and it was found that there was a rapid increase directly after rain. If a drought was long-continued, they fell off again, because they died. The number of microbes in the streets of Paris was in the average about 21 or 22 in the cubic foot, and that agreed with that found in the streets of Dundee, namely, 20 in the cubic foot. Outside Paris the number fell off to 2; whereas in dirty, one-roomed houses in Dundee 3,430 had been found, and 3,170 in a neglected hospital ward in Paris. They could not be surprised that the washings of the air by rain accumulating in the mud of thoroughfares should be a gathering-ground for microbes. The mud of streets did more than that. It provided food for their growth. It was the great source of bacterial propagation. When they opened their windows on a dry, dusty day, to let in fresh air, they were welcoming those small visitors. It might appear judicious to keep their windows closed under such

a siege, but a moment's reflection solved the difficulty. They did not know to what degree those microbes were mischievous, but they did know to what extent a fresh supply of oxygen was necessary to health. Let them admit air, but keep their dwellings as far as possible free from dust. An idea of the great army of microbes which were constantly on the march out of a big town might be gathered from the number computed for Paris, namely, 40,000 millions daily. Subjects of importance in this connection which might be dealt with were the possibility of reducing domestic smoke, the smoke of our warehouses and office buildings, the better utilisation of coal and the use of gas for household purposes. He would specially impress upon his hearers the value of pure air as indispensable to health. They should not be like people sitting in a close room, and by gradually becoming accustomed to their surroundings, grow oblivious to the polluted atmosphere they were breathing and the poison they were breathing. A chairman at a lecture once said he thought too much was made "of these invisible things; we seem to keep alive in spite of them." His answer to that was that they did not want merely to keep alive; they wanted to live without the burden of trying to keep alive. Impure air, whether it arose from bad gases, soot, or disease germs, was a poison. If the health of a town was slowly undermined, as it was assuredly by causes which they could compass and prevent, they must face those causes and stamp them out. There was much that the local authority could, and ought to do, and which they should collectively see was done, but there was much that they, as individuals, should do themselves.

SOCIETY OF ENGINEERS.

THE first ordinary meeting of the Society of Engineers for the present year was held on Monday evening, February 12, at the Town Hall, Westminster. Mr. W. McIntosh Valon, J.P., the president for 1893, first occupied the chair, and presented the premiums awarded for papers read during his year of office, viz. the President's gold medal to Professor V. B. Lewes, for his paper on "Gas Substitutes;" the "Bessemer Premium" to Mr. R. Nelson Boyd, for his paper on "Collieries and Colliery Engineering;" a "Society's Premium" to Mr. E. G. Mawbey, for his paper on the "Leicester Main Drainage, &c.," and "Society's Premium" to Mr. Robert Carey, for his paper on "Hydraulic Lifts."

Mr. Valon introduced the president for the present year,

Mr. George A. Goodwin, to the meeting, and retired from the chair, receiving a hearty and unanimous vote of thanks for his services during the past year.

The President having taken the chair, prefaced his address by referring to the satisfactory progress and condition of the Society, stating that its position was better than it had ever been, and that the *raison d'être* of its existence was a worthy and a much appreciated one, viz. to hold out a helping hand to the younger members of the profession, to offer them special inducements in taking part in the discussions on the papers read at the monthly meetings, and the making of the annual summer visits to works of engineering interest under construction or completed, where again useful information was obtained and of special value to the younger members.

After referring to last year's visits and the work of the Society, he commenced his address proper, which dealt with the present position and practice of mechanical engineering.

Boilers being the most usual form of apparatus whereby motive power is obtained to put all machinery in motion, he naturally dealt with them first, pointing out rapidly the growth up to the present types, viz. Lancashire, Galloway, marine, locomotive and water tube, &c., and mentioned the chief points in each, both in construction and working, recommending mild steel of a certain quality and properly tested for strength, ductility and temper.

Feed heaters were then dealt with and their great advantages pointed out, the live steam-pipe being particularly referred to, as also the probable reasons for its efficiency.

Mechanical stoking was described under two heads, viz. sprinklers and coking, the latter of which he considered gave more perfect combustion. The smoke nuisance was then discussed, and suggestions thrown out for its abatement, the ordinary household grates being responsible for 95 per cent. of that due to the 4,000 tons of fuel burnt daily in London alone giving probably 3,000 tons of carbon thrown into the atmosphere.

Steam-engines came next in order, and after describing the probable first application of heat to doing work 2,100 years ago—when the doors of temples were opened and shut by the placing or removal of fire on an altar—some of the various forms of engines and valve gears were mentioned; efficiencies, both thermal and mechanical, were alluded to, and examples of the best results were given, for the former 12.05 lbs. of water per one horse-power having been reached, while 94 per cent. for efficiency.

Internally Fired Engines: Gas and Oil.—The many improvements made in recent years, culminating in the use of ignition tubes, self-starters, better thermal efficiency and larger powers were described. Questions such as late ignitions, scavenging, varying explosive charges as against cutting out, coupled engines and compounding were discussed as far as time would allow. Single cylinder engines were now made up to 160 indicated horse-power, while multiple went as high as 600. The consumption of gas had been reduced to 15 cubic feet per horse-power, while 10 lbs. is stated to have been reached, which, if worked by Dowson gas, only represented .8 lb. of coal per horse-power per hour. Mechanical efficiency of these engines could be taken as 80 to 85 per cent. at full power. While in 1860 the thermal efficiency was only 4 per cent., it was now 26 per cent. As an example of high running powers of gas engines, the President referred to an engine he had seen where 800 explosions took place per minute, e.g. 1,600 revolutions. With regard to oil engines, their action was described and results of tests carried out by reliable engineers referred to, the largest engine yet made being 90 horse-power.

Marine engineering was fully commented on, the first steamer of the P. and O., 1829, of 206 tons and 6½ knots speed, and some of the Atlantic liners being those chosen as a basis for review. It was mentioned that while one ton of coal in the *Iberia*, 1837, propelled 17 tons 221 miles a day, one ton in the *Campania*, 1893, propels 28 8 tons 601 miles in the same time; also that in the former 5 6 lbs. of coal were used per indicated horse-power per hour, the latter only required 1 5 lbs., while 1 17 lbs. had been reached in another vessel.

The President then fully dealt with artificial draught, but chiefly Howden's forced and Ellis-Eaves induced, and gave results of working, whereby it appeared that with either the power of the boiler can be doubled with safety, as much as 22 indicated horse-power being obtained for each square foot of fire-grate, so that space is saved and cargo-carrying capacity increased, less firemen required, and an inferior coal could be used. The advantages and disadvantages of each were commented upon; the former, however, he considered, favoured the Ellis-Eaves. Its application to land boilers and central power stations was also dilated upon.

Railways.—Here the President referred to most of the chief details in connection with the system, viz. rails and fastenings, including the permanent security of the keys, which had never yet received much attention, style of carriages,

carriage lighting and heating, locomotives and their developments, including compounding and use of liquid fuel, variable blast pipes, and test for tyres and axles.

A review of iron and steel manufacture was next dealt with, pointing out where developments had taken place in heating, handling and output.

Electricity followed on, and references made to its various applications, including that for printing the daily and weekly papers when power was only required for short periods per day, saving initial outlay, space, attendants and firing-up losses. Suggestions were also made that electric light companies should sell current for power purposes at any time of day or night at a reduced charge. Electric cable and steam traction was then reviewed, as also the particulars of the systems and costs of working.

Water-power and dredging plants of modern design were described, and, lastly, a short statement of refrigerating machinery developments was gone into.

In conclusion, he gave a few words of advice to the younger members who had elected to follow the noble profession of an engineer, recommending a sound practical training by day with theoretical study in evenings; to follow up some specialty to the hilt, but at same time to obtain and maintain a good general knowledge of other branches, and stated in the words of Francis Bacon—

"I hold every man a debtor to his profession; from the which as men of course do seek to receive countenance and profit, so ought they of duty to endeavour themselves by way of amends to be a help and ornament thereunto."

CITY CHAMBERS, EDINBURGH.

At a recent meeting of the Edinburgh Town Council, Dean of Guild Miller brought forward a motion to consider as to utilising the ground on the west side of the Royal Exchange Square, which was scheduled under the Act of last year. The report of a sub-committee that had considered the question has been laid before the Lord Provost's committee, when the Dean explained his scheme for altering and extending the present city chambers. He pointed out that the present site had been found most suitable for the town's business, and all former council chambers had been within a stone's throw of the existing buildings, which were 140 years old, and were of such a

substantial nature that they might be handed down to posterity for many years to come. They had been used by the Council for eighty-three years, and with certain additions and alterations they might be made suitable and convenient for the business of the city for several generations. Great consideration should, however, be given to the alterations to be made, so that they might do nothing that would stand in the way of a complete set of city chambers. The present front towards the Exchange Square should be allowed to remain, as well as the present stair, which was a very good one. The first change that ought to be considered was the position of the burgh court-room. That should be placed on the level of the square, so that the criminal or judicial department would be separated from the municipal departments. The burgh court-room and other rooms for the Clerk of Court and Procurator-Fiscal should be placed at the north-west corner of the square, where the Corporation now owned part of the property, and had power under the Act of last year to acquire the remaining property for necessary improvements. He suggested that in the near future they should look forward to having a larger council chamber. That could be conveniently placed over the new burgh court, and the officials' rooms on the same level as the present council chamber. The new council chamber which he proposed would be large enough for future requirements, even though Leith, Portobello, Granton and Duddingston were added to the city of Edinburgh. It would also be suitable for the licensing courts and other meetings of the justices of the peace, &c., instead of those meetings being held as at present in another building. The present council chamber, he suggested, should be used as the Lord Provost's room, excepting the space at present reserved for the public, which would form an ante-room. The present burgh court would be divided—one part forming an ante-room to the council chamber, the other forming the council officer's room. Should these changes be carried out, sufficient accommodation would be found for the city chamberlain and others who were urgently demanding larger and better premises. Mr. Morham had made sketches for future requirements, both at the north-west corner to Cockburn Street and to Craig's Close in the east, but he (the Dean) only proposed that one section should be taken up at a time, and that in the meantime they should confine themselves to the extensions which he proposed in the old Heriot buildings. The proposal of the Dean was recommitted to the sub-committee to bring up more detailed plans of the first block, with outline plans of the proposed future additions.

RUBBISH AND ELECTRIC-LIGHT.

ENORMOUS power, says the *Leeds Mercury*, lurks in the common dust-heap. Generally speaking, no use whatever is made of it at the present time. On the contrary, municipalities spend large sums of money in ridding themselves of this material, which is looked upon as a tiresome and useless encumbrance. That it must be destroyed no one will deny, and that cremation is the best means of accomplishing its destruction is equally certain. Millions of tons are dealt with after this manner annually. The process involves an appalling waste of energy. Is it possible to arrest the loss of power? This, surely, is a question of great importance to municipalities, and any serious attempt to solve the problem is worthy of consideration. The British Steam Generator and Refuse Utilisation Company, Limited, claim that they have in the Livet system of generating steam by the destruction and combustion of town refuse a means whereby corporations and other local authorities may turn to profitable account the rubbish which day by day comes into their possession.

An experimental station has been established by the company at King Cross, Halifax, and there the satisfactory utilisation of ordinary town refuse may be seen in actual operation. The material goes into the furnace just as it is delivered by the contractor to the Corporation. It undergoes no sorting whatever, and it is cremated without the production of smoke or smell. The chief feature of the Livet furnace is that the flues are so formed that the decreasing volume of gases of combustion travelling towards the chimney are made to give the air passing through the furnace bars a high velocity, producing rapid combustion and intense heat; whilst the gases themselves move so slowly through the flues that they part with all their useful heat before escaping into the atmosphere. The area over the bridge of the surface is very slightly larger than the area of the total air-space of the firegrate. Air is brought in close contact with every part of the combustible matter, and complete combustion, it is claimed, takes place. After the bridge is passed the flues begin to expand, and then the expansion continues to the chimney, so that the gases are gradually cooled, and brought into a state of tension, or partial vacuum. This accounts for the increase of draught through the fire-bars, and it also retains the gases round the boiler until full use has been made of the economical heat contained in the products of combustion. The temperature of the gases just before entering the chimney is stated to be from 300 to 400

IMPORTANT NOTICE.—The severe loss sustained by the failure of Safes at the recent fires at Cork, St. Mary Axe, and the Mauritius has demonstrated to us that Safes with the usual thickness of fire-resisting chambers are insufficient. All "RATNER" Safes in the future will have fire chambers of increased strength without extra cost.

RATCLIFF & HORNER, LD., 159 QUEEN VICTOR A ST., LONDON, E.C.

Telephone 15,008. Telegraphic Addresses: "City Thiefproof Works," "Savealls." Trade Mark: "Ratner."

degrees Fahrenheit lower than that usually prevailing at this point. Another important advantage is also derived from this special construction of flue. In the ordinary refuse destructor a difficulty is experienced owing to the way in which the flues become choked with dust, but in the Livet furnaces there are chambers in which the gases are for a time in a state of rest. The particles of dust then settle to the bottom, and are collected in boxes, which can readily be removed. At Halifax the furnaces have now been working three months, and it is said that practically no dust has been found in the flues. With regard to the heating surface of the Livet boiler, it is 50 to 1 as compared with the grate surface, whereas ordinarily the ratio is not more than 30 to 1.

So much for the apparatus. What are the results achieved? Tests have been made from time to time in the presence of independent engineers. With Halifax rubbish the consumption of 1 lb. has evaporated 4·08 lbs. of water. A pound of rubbish from Bradford evaporated 3·65 lbs. of water, from Harrogate 3·39 lbs., and from Huddersfield 3·59 lbs. Up to a certain point it has been found possible to rely on rubbish alone. At the Kensington Court Electrical Station, London, where there are two Livet boilers similar to those at Halifax, 300 horse-power can be obtained with town refuse. When greater power is needed, coal is mixed with the rubbish, and the proportion of coal to refuse gradually increased until 790 horse-power is reached, when, if further energy is needed, coal alone is used. The two Livet boilers at Kensington, during one day of twenty-four hours, evaporated 124,700 lbs. of water, consumed half a ton of coal and 17 tons of rubbish, giving an average horse-power per hour of 259·8, the highest being 795 and the lowest 40. This plan of using coal when the period of heavy load comes round is, it is maintained by the proprietors of the Livet system, greatly superior to the method of having such a number of boilers under steam as shall be equal to the provision of the maximum power when it is demanded, involving heavy loss by banking fires, radiation of heat, and fixed charges. It is estimated that the cost of producing one horse-power per annum with coal is 9*l.* 2*s.* 2*d.*, with rubbish alone 3*l.* 3*s.* 2*d.*, and with rubbish assisted by coal 2*l.* 14*s.* 9*d.* By way of explanation of these somewhat curious and startling figures, it is where the average "load" does not exceed three-tenths of the total load that power can be produced by "assisting" rubbish with coal at a less cost than if refuse alone were burnt, because a less amount is sunk in the boilers and a smaller proportion of men have to be employed. To those

who would be unable to consume town rubbish it may be of interest to know that tests are said to have proved that as a steam generator, where coal alone is used as fuel, a saving of 30 per cent. is effected by the use of the Livet furnace.

To what end is this power, when produced, to be used? The company who own the Livet system of utilising rubbish say that the natural way will be to light the locality by electricity. And they practise what they preach. At Halifax they have an electric light installation connected with the boilers at King Cross, and they claim that they can there produce 250,000 candle-power by burning the town's refuse, without mixing it with coal or preparing it in any way. There are several arc and incandescent lights burning at the works, and on the roof of an adjoining mill there is a 25,000 candle-power search-light, which astonishes the neighbourhood each night. Thus they demonstrate that towns can be illuminated by electric light at a cost, so far as motive power is concerned, of less than nothing, taking into account the expenditure now involved in the destruction of refuse. The average quantity of rubbish produced in a town of 300,000 inhabitants is supposed to be about 150 tons a day in winter and 116 tons in summer, a quantity believed to be more than sufficient to light the district with electricity. To consume the whole energy produced by 150 tons of rubbish per day would require twenty-four boilers, including one standby, whilst the average demand would be equal to the constant power of ten boilers. In summer the number of boilers required to consume 116 tons of refuse would be seven.

How would this system be applicable to Leeds? Not at present in the production of electric light, for that duty devolves on a private company. It may, however, be worth the while of the city authorities to determine whether it could be profitably used in generating electricity for the tramways, should electric haulage be ultimately decided upon. It is contended that by using the Livet destructors the cost per electric car mile is reduced from 3·90*d.* to 1·68*d.*

BUILDING SITES IN NEW YORK.

ONE of those extraordinary instances of carelessness which occur from time to time in New York in relation to building operations, says the *American Architect*, forms the theme of various articles in the daily papers. It seems that a certain Mrs. Shanks undertook to build a house on land belonging to

NEW PATENT MICA VALVE VENTILATOR.

her in Harlem. The house was built, but, after it was all done, it turned out to have been built, not on Mrs. Shanks's lot, but on the adjoining one, which belonged to a Mrs. Williams. Mrs. Williams's astonishment on finding that her land had been enriched at some one else's expense with a four-storey house, was hardly less than that of Mrs. Shanks at finding that she had bestowed her money on her neighbour; while three lawyers, who held as many mortgages for money advanced to build the house, were by no means agreeably surprised to find that they had advanced 9,500 dollars on a piece of real estate which still remained vacant, and which would not sell for more than 4,000 dollars. However, troubles of that kind are soon righted among honest people. Mrs. Williams told Mrs. Shanks that she would take no advantage of the mistake, but would sell her the lot on which the house stood at its value as vacant land; and in her turn, Mrs. Shanks informed her mortgagees that when the lot was transferred to her she would transfer the mortgages from the unimproved to the improved property. This programme was carried out, and all parties are now, we hope, enjoying the contentment which only a clear conscience can give. It is singular that mistakes of this kind should be so common in New York, where the rectangular and uniform disposition of the streets makes it particularly easy to stake out lots correctly; but this is the third or fourth instance within a few years of a house having been built entirely on the wrong lot of land. So far as we know, a friendly and honourable arrangement has been made in each case; but, if some avaricious owner should try to retain the property thus wrongly bestowed upon him, it might turn out that the responsibility of the surveyor who staked out the lot would be unpleasantly called in question.

THE QUERETARO AQUEDUCT.

ONE of the oldest aqueducts in Mexico was built a century and a half ago to supply the city of Queretaro. The aqueduct, which bridges water five miles, has seventy-four impressive arches, through one of the highest of which the tracks of the Mexican Central Railroad pass. The Mexican aqueducts were not arranged to deliver water under any considerable pressure; they either supplied a series of gutters passing through the town or discharged the water under light pressure at fountains, whence it was carried in vessels on the heads or backs of women, on the backs of burros, or on wheelbarrows or carts especially arranged for the purpose. There seems to be a con-

siderable opening in the near future for hydraulic engineering in the Republic of Mexico. Very few of the more important towns have water brought and distributed under pressure, and as advancements are made the number of those which provide for a water-supply will probably increase. The city of Mexico has lately contracted for additional water-supply, and an English contractor is now completing a gravity system under high pressure for the city of Pachuca.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 1860. George Harry Kirk, for "An automatic sash-fastener."
- 1869. George Oulton, for "Improvements in or connected with taps for baths, lavatory basins, and other similar purposes."
- 1874. William Charles Dudley Smith, for "Improvements in connection with locks or drop-latches for doors and such like purposes."
- 1882. William Colin Morison, for "Improvements in and connected with chimney and ventilating shaft-tops."
- 1944. Samuel Hambly, for "New or improved method of hanging window-sashes and appliances for use in connection therewith."
- 1960. Henry Smith, for "Improvements in and relating to valves."
- 1968. Charles William Alexander Taylor, for "Improvements in water gauges."
- 2002. Edward G. Brewer, for "Improvements in or connected with smoke-consuming furnaces and other grates."
- 2021. Fred. George Kely Caston, for "Improvements in buffers for railway and other vehicles."
- 2238. George Franklin Jennings, for "Improvements in hoisting apparatus."

COMPETITIONS OPEN.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

KIRKCALDY.—March 17.—Plans, &c., are invited for proposed Beveridge Public Hall, Free Library and Adam Smith Memorial Hall, &c. Mr. W. Roy Spears, Town Clerk.

MACHYNLLETH.—Feb. 28.—For Scheme of Water Supply and Sewerage. Premium of 40l. is offered. If the Engineer whose scheme is selected is appointed to superintend the execution of works, the premium merges into his commission. Mr. David Humphreys, Inspector of Nuisances, Machynlleth.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150l. and 50l., premium to merge. Mr. H. H. Hicknott, Town Clerk

CONTRACTS OPEN.

ABERAMAN.—March 1.—For Building Police Station. Mr. T. Mansel Franklen, Clerk of the Peace, Glamorgan County Offices, Westgate Street, Cardiff.

ABERDEEN.—March 1.—For Construction of Fireclay Pipe Sewers, Cast-iron Pipe Sea Outfalls, &c, Gardenstown. Messrs. Jenkins & Marr, Engineers, 16 Bridge Street, Aberdeen.

ABERKENFIG.—March 3.—For Building Police Station. Mr. T. Mansel Franklen, Clerk of the Peace, Cardiff.

ANERLEY.—March 2.—For External Painting of District School. Mr. A. G. Hennell, Oakwood, Mayow Road, Forest Hill.

ANTRIM.—March 5.—For Building Lunatic Asylum at Holywell. Mr. J. Lanyon, Architect, Northern Bank Chambers, Royal Avenue, Belfast.

BARNLEY.—Feb. 26.—For Building Residence, Stabling, &c. Mr. R. Dixon, Architect, 5 Eastgate, Barnsley.

BARNLEY.—Feb. 26.—For Building Six Houses. Messrs. Wade & Turner, Architects, 10 Pitt Street, Barnsley.

BATH.—Feb. 24.—For Execution of Work, Supply of Materials, &c., for One Year. Mr. C. R. Fortune, City Surveyor, 3 Terrace Walk, Bath.

BELFAST.—Feb. 23.—For Building Lecture Hall to Carnmoney Presbyterian Church. Messrs. Young & Mackenzie, Architects, Donegall Square East, Belfast.

BILLINGSGATE.—Feb. 27.—For Construction of Underground Conveniences. The Engineer to the Commissioners of Sewers, Guildhall, E.C.

BISHOP'S STORTFORD.—March 5.—For Supplying Steam Cooking and Heating Apparatus at the Workhouse. Mr. Henry Baker, Clerk to the Guardians, Bishop's Stortford.

BLOXWICH.—March 12.—For Building Infants' School. Messrs. Bailey & M'Connell, Architects, Bridge Street, Walsall.

BODMIN.—Feb. 24.—For Building Board Schools. Mr. W. J. Jenkins, Architect, Bodmin.

BOTLEY.—Feb. 26.—For Building Seven Houses. Mr. John H. Brearley, Architect, Commercial Street, Botley.

BRIGHTLINGSEA.—March 5.—For Improvements and Re-benching Chapel. Mr. Charles Pertwee, Architect, Bank Chambers, Chelmsford.

BRIGHTON.—March 8.—For Construction of Swimming-bath, North Road. Mr. Francis C. J. May, Borough Engineer, Town Hall, Brighton.

BUCKHURST HILL.—March 3.—For Tar-paving the Playgrounds and Footpaths at Boys' Board School. Mr. E. Egan, Architect, Chigwell.

BUCKHURST HILL.—March 3.—For Enlargement of the Boys' Board School. Mr. E. Egan, Architect, Chigwell.

BURNLEY.—Feb. 28.—For Building Sulphate Works at Gasworks. Mr. F. S. Button, Borough Surveyor, Town Hall, Burnley.

BURNLEY.—For Additions to Paper Works. Mr. John Bradley, 14 Market Street, Bury.

CARDIFF.—Feb. 23.—For Building House. Mr. E. W. M. Corbett, Architect, Castle Street, Cardiff.

CARDIFF.—Feb. 28.—For Construction of Sewers, Flushing Tanks, &c, Whitchurch. Mr. W. Fraser, Engineer, 275 Cowbridge Street, Cardiff.

CARLISLE.—Feb. 28.—For Restoration (after fire) of Crown Inn. Messrs. Beaty Bros., Devonshire Street, Carlisle.

CHELMSFORD.—Feb. 28.—For Building Gymnasium at King Edward's Grammar School. Mr. Charles Pertwee, Architect, Bank Chambers, Chelmsford.

CLOWN.—March 1.—For Additions to Board Schools. Messrs. Rollinson & Son, Architects, 13 Corporation Street, Chesterfield.

CO. SUTHERLAND.—March 5.—For Construction of Three Harbours. Mr. James Barron, Engineer, 7 Union Terrace, Aberdeen.

CRANBROOK.—Feb. 28.—For Supply of Road Material. Mr. T. H. Crampton, Cranbrook, Kent.

CROMER.—Feb. 26.—For Construction of Pipe Sewers. Mr. A. F. Scott, Surveyor, Local Board Offices, Cromer.

DARWEN.—Feb. 28.—For Alterations to County Police Station. Messrs. Varley & Sandbach, Architects, 15 Richmond Terrace, Blackburn.

DENABY MAIN.—For Building Hotel.—The Messenger Colliery Offices, Denaby Main, Yorks.

DISTINGTON.—March 1.—For Building Shop, Warehouse and Dwelling-house for Messrs. Fox Bros., Distington, and 8 Fisher Street, Workington.

DUBLIN.—Feb. 27.—For Building Artisans' Dwellings. Mr. Spencer Harty, Borough Surveyor, 82 Dame Street, Dublin.

EASTBOURNE.—March 1.—For Boundary Walls for Enlargement of Cemetery. Mr. H. Euean Rumble, Architect, 27 Hyde Gardens, Eastbourne.

EBBW VALE.—March 1.—For Building Public Hall, Shops, Offices, &c. Mr. E. A. Johnson, Architect, Abergavenny.

FAILSWORTH.—Feb. 28.—For Construction of Two Main Outfall Sewers, Pipe Sewers, &c. Messrs. Lomax & Lomax, Engineers, 29 Grosvenor Chambers, Deansgate, Manchester.

FAREHAM.—Feb. 26.—For Building Block for Fifty Children at County Lunatic Asylum. Mr. B. S. Jacobs, Architect, Lincoln's Inn Buildings, Hull, and 88 Bishopsgate Street, E.C.

FLEET, HANTS.—For Building Residence. Messrs. Ludford & Tulloch, Architects, 39 Victoria Street, S.W.

VERITY BROS. CALL LANE, LEEDS.

Manufacturers of their High-Class

ROLLING BOLT, MORTICE & RIM LOCKS, NIGHT LATCHES, &c.

In our Deadweight Lock as per drawing herewith, we have so applied the different Movements that the pressure is equal in both ways of turning the knob, and we guarantee their giving entire satisfaction.

We are also Manufacturers of—

The largest Varieties of Openers suitable for Skylights, Fanlights, &c., which can be fixed in any position.

Casements in Wrought Iron, Steel, and Gun Metal.

Espagnolette Bolts, Weather Bars, Sash Fasteners, Door Checks.

CATALOGUES FREE BY POST.

GATESHEAD.—Feb. 28.—For Building Board Schools, Brighton Avenue. Messrs. Oliver & Leeson, Architects, Bank Chambers, Newcastle-on-Tyne.

GLASGOW.—March 1.—For Embanking North Side of the River Clyde (230 Yards). Mr. A. B. McDonald, City Engineer, 64 Cochrane Street, Glasgow.

GLASGOW.—March 5.—For Works in Construction of Gate Lodges, Waiting-rooms, &c., at Botanic Gardens. Mr. A. B. McDonald, City Engineer, 64 Cochrane Street, Glasgow.

HALIFAX.—March 5.—For Taking-down Old Buildings and Erection of Schools. Mr. Joseph F. Walsh, Architect, Waterhouse Chambers, Halifax.

HANLEY.—Feb. 26.—For Building Shop and Residence. Mr. Ambrose Wood, Architect, Regent House, Hanley.

HARWICH.—March 6.—For Building Board Schools, Boundary Walls, &c., Upper Dovercourt. Mr. J. W. Start, Architect, Cups Chambers, Colchester.

HEMSWORTH.—March 6.—For Supplying and Laying Pipe Sewers. Mr. Richardson, Surveyor, Imperial Buildings, Bond Street, Leeds.

HIGHAM.—Feb. 26.—For Construction of Engine and Boiler House and Reservoir, Higham, Rochester. Messrs. Easton & Co., Engineers, 11 Delahay Street, Westminster.

HORNSEY.—Feb. 23.—For Execution of Sewerage and Drainage Work, Street Watering and General Cartage Work, Concrete Footway Pavements, and the Supply of Stoneware Pipes and other Stoneware Goods, Broken Granite and other Road Materials, Broken Stone for Macadamising, Paving Granite and General Masons' Materials, Portland Cement, Grey Stone Lime, for One, Two, or Three Years. Mr. F. D. Askey, Clerk to Local Board, Southwood Lane, Highgate, N.

HYDE.—Feb. 26.—For Building Cemetery Chapels. Messrs. J. W. & R. F. Beaumont, Architects, 10 St. James Square Manchester.

KING'S NORTON.—Feb. 26.—For Erection of Two Chapels, Two Lodges and Front Boundary Wall for projected Cemetery. Mr. F. B. Andrews, Architect, A.R.I.B.A., 102 Colmore Row, Birmingham.

LEEDS.—Feb. 26.—For Building Board School for Infants, Castleton. Mr. W. Packer, Clerk to the School Board, Leeds.

LEYTON.—March 13.—For Building Public Offices and Technical Institute. Mr. John Johnson, Architect, 9 Queen Victoria Street, E.C.

LINDSAY.—Feb. 28.—For Erection of a Court-house and other Police Buildings, Roads, &c. Mr. James Thropp, 29 Broadgate, Lincoln.

LIVESFY.—Feb. 26.—For Building Vicarage. Messrs. Stones & Gradwell, Architects, 10 Richmond Terrace, Blackburn.

LLANELLY.—March 10.—For Building Town Hall and Public Offices. Mr. Wm. Griffiths, Architect, Falcon Bridge, Llanelly.

LIANHILLETH.—March 1.—For Building Board Schools. Messrs. Alfred Swash & J. Bain, Architects, 3 Friars' Chambers, Newport, Mon.

LLANISHEEN.—For Building Infants' Wing to Schools, and Addition to Master's House. Messrs. Kempson & Fowler, Architects, 16 High Street, Cardiff.

LLWYDCOED.—Feb. 27.—For Building Cottage at Railway Station. Mr. G. K. Mills, Secretary, Paddington Station, W.

MALDON.—March 1.—For Rebuilding Stables at the Blue Boar. Mr. J. W. Start, Architect, Cups Chambers, Colchester.

MANCHESTER.—Feb. 23.—For Building Fruit Auction Sale-room, Shops, Offices, &c. Mr. John Allison, City Surveyor, Town Hall, Manchester.

MARKET DRAYTON.—Feb. 27.—For Erection of Goods Shed with Offices at Great Western Railway Station. Mr. G. K. Mills, Secretary, Paddington Station.

MARYPORT.—Feb. 26.—For Reconstruction of Warehouse. Messrs. Johnstone Bros., Architects, 39 Lowther Street, Carlisle.

MYNYDDISLWYN.—Feb. 26.—For Additions to Board Schools. Mr. George Rosser, Architect, Albion Chambers, Newport, Mon.

NELSON.—Feb. 25.—For Building Cemetery Chapels. Mr. H. Whitaker, Architect, 26 Every Street, Nelson.

NELSON.—March 15.—For Building Sludge Press-House, Cake Stores, with Sludge Reservoir, &c. Mr. J. W. Bradley, Borough Engineer.

NEWCASTLE.—March 3.—For Supply of Building Materials for War Department Buildings and Property, for a Period of Three Years. Lieut.-Colonel G. Hildebrand, R.E., Newcastle.

NEWINGTON.—Feb. 26.—For Supply of Road Material for One Year from March 25. Mr. L. J. Dunham, Vestry Hall, Walworth, S.E.

NORTH-EASTERN RAILWAY.—Feb. 28.—For Supply of Four Pairs of Wrought-iron Lock Gates. Mr. T. M. Newell, Dock Office, Hull.

WOMBWELL.—Feb. 26.—For Building Three Shops, Houses, &c. Mr. John Robinson, Wombwell.

WOOD GREEN.—Feb. 23.—For Tar-paving Works. Mr. J. W. Britton, Town Hall, Wood Green.

THE *Glasgow Herald* says:—Sir Charles Hartley, engineer, now engaged on the Danube Commission, will go out at the end of the year to advise the Chinese Government as to the best method of deepening the entrances of the Yangtze. The Chinese local authorities employed a dredger for two years on it, but with no appreciable effect. The visit of Sir Charles Hartley will, it is thought, cost 3,000*l*.

HALLIDAY'S CLAPTON LIGHTS.

Simple, Powerful, Economical. Reflection and no Complication.

OPEN TOP, AS SHOWN, OR VENTILATING. PLAIN OR ORNAMENTAL.

Much used in Places of Worship, Lecture Halls, Board Schools, Shops, Large Offices, Markets, &c.
Suitable for wherever a Very Powerful, Well Diffused, Soft, Economical, and
Easily Managed Gas Light is desirable. Made in Five Sizes.

HONoured WITH SUNDRY IMITATIONS.

Seven years from Invention up to April 1890 over 11,300 sent out. But
Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong.
R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

KALLKOLITH.

NEW PATENT PRIMING AND STAIN.

Acknowledged by experts of nearly every country to be one of the most important inventions of the Nineteenth Century.

KALLKOLITH is one of the most marvellous inventions of the present age, and is used as a priming in place of the now almost obsolete oil-colour. It produces an exquisite smoothness, combined with great durability, and amalgamates thoroughly with wood, iron, cement stone, plastering, &c.

CHEAPNESS.—It saves at least 100 per cent. in comparison with any other priming now in use, being less than half the weight.

ECONOMY is manifested by the fact that one 14-lb. tin of **KALLKOLITH** goes further than three times the same quantity of oil-colour.

DRYING POWERS.—It dries within one to two hours, thereby greatly facilitating the quick dispatch of labour.

DURABILITY.—Where **KALLKOLITH** is used it imparts an amount of durability to all oil-colours used upon it which has never yet been obtained, and one of the most important advantages in its use is that the paint put upon it does not blister.

PAPER-HANGING.—Walls prepared with **KALLKOLITH**, thinned with seven parts of water, give a great additional advantage to the hanging of all descriptions of papers.

Price per case of 8 Tins of 14 lbs. each, net 40s., packing included. Special Terms to Wholesale Buyers and Shippers.

AN inquiry has been held by the Local Government Board at Brownhill in respect of carrying out sewage disposal works at Walsall Wood. It is proposed to borrow 10,000*l.* to carry out the scheme.

ELECTRICAL.

At the meeting of the Improvement Committee of the Sheffield City Council the question of the method of lighting the new Town Hall was considered, and the following resolution was passed:—"That provision be made for a supply of electricity throughout the new Town Hall, and for a modified supply of gas to light the corridors and staircases; that the architect be requested to report to what extent this modification of gas supply will reduce the contract; and also to report whether, in his opinion, it would be desirable to dispense with gas altogether, and in that case what further reduction would be effected."

At the meeting of the Birmingham City Council a scheme for lighting the Market Hall by electricity was adopted, and the Finance Committee instructed to borrow 1,000*l.* for providing the necessary lamps, fittings, &c. Some time past the lighting of the market had been very unsatisfactory. Electricity will prove cheaper than gas. The first reason for this was because of the wasteful character of the gas-lighting of the Market Hall, and the second because of special terms from the electrical company.

ELECTRIC light has been installed in the church of St. Mary-at-Hill, Eastcheap, which for some two years has been closed for works of repair.

TRADE NOTES.

At Driffeld Mr. Prince Smith, J.P., has erected a water tower at his residence, Southburn Street, and amongst many other improvements has placed a beautiful illuminated clock and bell on the side facing the highway, for the benefit of the public at large. The necessary work has been executed, from instructions received from Mr. James Ledingham, architect, Bradford, by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds, who have also just erected a new clock for Mr. H. Andrews, J.P., Swarland Hall, Felton, and one for the new portion of the N.E.R. station, Newcastle.

THE Handsworth School Board have accepted the tender of Mr. J. Webb, of Villa Road, for the erection of Board schools in Wattville Street at a cost of 12,434*l.*

THE engineering work in connection with the swimming and private baths at the St. Bride's Institute is being carried out on the "Roshier System" by the Rainbow Engineering

Company, Limited, of 39 Victoria Street, S.W., who are also doing the air-heating of the building. The "Roshier System" is also being employed at the new public baths just opened at Ipswich, the work being carried out by Mr. Henry Prince, of 3 Victoria Street, London, S.W.

AMONG other valuable health-promoting appliances of the present day, what is styled the "Silent Mica Flap Smoke-proof Chimney Breast Ventilator," new patent by Messrs. Comyn Ching & Co., is well suited to meet the requirements of the day. It is an improvement in several respects on Messrs. Comyn Ching & Co.'s original mica flap ventilator, which has been so extensively appreciated by the public and has consequently been imitated to a discreditable extent.

THE London County Council have decided on an extension of the Wandle Branch Sewer at a cost estimated at 9,000*l.*, and the construction of a new sewer from Hammersmith Road to Walham Green, the approximate cost of which is taken at 25,700*l.*

VARIETIES.

THE Limerick Corporation have decided to borrow 10,000*l.* from the Government to erect artisans' dwellings.

At the meeting of the Edinburgh Dean of Guild Court a warrant was granted to the application of Mr. Andrew Scott, C.A., secretary, to add a new wing to the Royal Maternity Hospital, Lauriston. The new wing at the Maternity Hospital will provide on the basement flat a lecture-room; on the street floor a dispensary, receiving-room and three wards; on the first floor a staff-room, nurses' sitting-room and two wards; and on the second floor nurses' sleeping accommodation.

THE Islington Vestry have unanimously decided to oppose the portion of the London County Council's Improvement Bill for reconstructing Highgate Archway, and widening and improving Archway Road and Hornsey Lane, at an estimated cost of 28,000*l.*, objecting to the proposal that they thenceforward maintain the thoroughfare.

NEW waterworks are proposed to be carried out for Naas, the cost of which is estimated at about 4,000*l.* An inquiry has just been held by the Local Government Board.

IN setting apart space in the Royal Aquarium for a Clubmen's Lounge, Mr. Josiah Ritchie, the active managing director, has hit upon an unique and successful issue. The

ground, which is carpeted in crimson, measures 160 feet by 46 feet; the lounge is handsomely and comfortably furnished with some hundred or so of perhaps the cosiest and easiest chairs extant, technically known as saddle bags. Chess and draughts are provided, and all the morning and evening papers and periodicals are arranged on reading stands and tables throughout. All these advantages are to be had for the small sum of 2*l.* 2*s.* half-yearly or 3*l.* 3*s.* annually, representing 1*s.* 2½*d.* per week, for which small sum clubmen gain admission to the building and have the further advantage of passing to and from the orchestra stalls. The lounge overlooks the great central stage, and Mr. Ritchie prides himself that the variety performances thereon appeal to the intellect, being generally interesting and clever. Probably at no place of entertainment in the world are so many changes of varieties to be seen. In addition to the two great central stage varieties, commencing at 2.30 and 7.30, and concert at 5.30 to 6.50 (to all of which visitors for one payment are entitled to remain), there are all sorts of attractions and side shows.

A PARTNERSHIP has been arranged between Mr. Alex. McCulloch, architect, and his chief assistant, Mr. Geo. Jamieson. Mr. Jamieson received his early training in the office of Mr. Alex. Hutcheson, and was also assistant to the late Mr. James Maclaren.

BUILDING AND BUILDERS.

At the annual meeting of the Aberdeen Royal Infirmary and Lunatic Asylum Corporation, Lord Provost Stewart presiding, Mr. David Littlejohn, chairman of the Infirmary, moved the adoption of the report, which showed that there had been 243 more patients than in the previous year, and a deficit in the accounts of 1,470*l.* With regard to the new hospital buildings 46,000*l.* had been spent, and there was still 4,000*l.* or 5,000*l.* in hand, and according to the best estimate the architects had made it would be foolish to reckon that future requirements would be less than 20,000*l.* The report was adopted, power being also given to the directors to borrow 20,000*l.* for the completion of the jubilee scheme of hospital reconstruction and extension. Mr. Alexander Walker, merchant, chairman of the Lunatic Asylum Board, presented the directors' report, and moved that 3,800*l.* be offered to the Infirmary Board for the Convalescent Hospital property, adjoining the Asylum, for reconstruction purposes. Mr. Wilson, architect, seconded, and the proposal was adopted.

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

THE annual dinner of the Hull Master Builders' Association was held at the Grosvenor Hotel, when a large number sat down to dinner, the president, Councillor Skinner, in the chair, supported, amongst others, by the Mayor, Councillors Scott and Wharram, Messrs. J. Bilson, F. S. Brodrick, P. Gaskill, J. Watson, architects; and Messrs. Marsden, Liggins, Beevers, Levitt, Good, Panton, Houlton, Jackson, Nicholson, Drury, Goates, Darnley, Bray, Townsley, Knowles, Fillingham, Temperton, Myers, Hunter, Hodgson, Beal, Eckles, Sweeting, Simpson, Blackburn, jun., Hirst and Southern.

At the annual dinner of the Dundee Master Builders' Association, the president, ex-Bailie Scott, in the chair, after the dinner, among other toasts, were:—"The Dundee Institute of Architects," by Mr. Stocks, replied to by Mr. Mackison; "Representatives from other Cities," by Mr. Macaulay, replied to by Mr. Adams, Glasgow; "The Timber Trade," by Mr. T. S. Robertson, replied to by Mr. Bell; "The Quarry-Masters," by Mr. Thomson, replied to by Mr. Galloway; "The Legal Profession," by Bailie Macdonald, replied to by Mr. Dickie; "The Clergy," by ex-Bailie Stuart, replied to by the Rev. J. Dowie; "The Ladies," by Mr. Bennet, responded to by Mr. Clark; "The Chairman," by Mr. Sutherland, Perth; and "The Croupiers," by Councillor M'Leish, Perth.

THE annual banquet of the Plymouth, Stonehouse, Devonport and District Master Builders' Association has just been held at Plymouth. Mr. A. N. Coles, president, took the chair, and the company included Messrs. H. Kerswill, vice-chairman; W. Laphorn, hon. treasurer; and C. L. Duke, hon. secretary. Mr. Yates proposed "Success to the Association," which was acknowledged by Mr. G. H. Smith, C.C. (Devonport), who contended that the events of the past few years had justified the formation of the Society. He hoped masters would always treat good workmen well, and that in the future employer and employé would work together in unity. Mr. S. Roberts submitted "The President," and dwelt upon the necessity of their supporting one another in endeavouring to obtain fair contracts by the inclusion of an arbitration clause. He also urged them to combine in insisting upon the quantities forming part of a contract. The Chairman, in response, congratulated the Association upon having satisfactorily settled disputes with their employés. He hoped the architects of Plymouth would meet them in a fair way in regard to an arbitration clause in contracts. In most parts of the country the clause was included, and but for a few men it would be adopted in

Plymouth. In another column will be found a report of the annual meeting of the Nottingham Master Builders' Association.

At the monthly meeting of the Leamington School Board the building committee recommended that the arches on which the Leicester Street schools are built should be converted into a school for manual training and cookery classes. Plans were submitted and passed.

THE Birmingham Town Council have decided on the purchase of a site on which to erect new market buildings.

BUILDING BY-LAWS, GLASGOW.

At the meeting of the architectural section of the Philosophical Society of Glasgow, Mr. Campbell Douglas in the chair, a paper on "The Glasgow Building Regulations Act of 1892" was read by Mr. George W. Barras, writer. Mr. Barras stated that this Act is the latest of a series of Acts affecting the city in its formation, sanitation and improvement. Since 1844 sanitary matters have been receiving the attention of the city authorities, but before 1862 no Act existed for regulating properly the erection and alteration of buildings, &c. In 1862 a General Police Act was passed, and in 1866 the Glasgow Police Act was passed. The Act of 1892 has altered and extended the 1866 Act as to buildings, streets, openings, drainage, ventilation, foundations and sanitary details. It is now generally admitted that two great causes of mortality in this and other large cities are diseases of the lungs and zymotic diseases. These are largely avoided by spreading the population over as wide an area as possible. Disease existed more than to double the extent in densely than in other populated districts. The percentage of Glasgow houses of one and two apartments is about forty-five and of houses above three apartments eleven. Mr. Barras gave an outline of the provisions of the Act of 1892, calling special attention to the clauses in regard to ventilation and drainage, the height of buildings and the cubic contents of apartments. The question of the ventilation of hollow squares, he stated, had aroused much difference of opinion, but it had been proved that small hollow squares were unhealthy and to be avoided. The question of free space had been brought before the Court of Session, both under the Act of 1866 and the 1892 Act, and the Court in a recent case held that the Act of 1892 did not repeal or modify the provisions of the Act of 1866 in this respect, but was simply explanatory thereof.

NEW CATALOGUES.

WE have received from Mr. H. Munzing, 199 Upper Thames Street, a new price list and order-sheet for screwed American malleable iron and cast-iron tube connections, in which several novelties have been included. The list prices have been revised (many considerably reduced). The sale of these fittings, since their introduction by Mr. Munzing into this country fifteen years ago, has been steadily increasing on account of their quality, neat appearance, trueness of angles, and low prices compared with wrought-iron fittings of similar descriptions. As to the accompanying engravings—

FIG. 1.

FIG. 2.

FIG. 3.

Fig. 1 shows a return band, of which two patterns, "open" and "close," are made. The return bends are specially suitable for making-up hot-water and steam coils. Fig. 2, the hexagon taper pipples, make a perfectly tight joint, and are easily fixed and disconnected by spanner. They are, therefore, in every respect superior to the plain pipples. Fig. 3, radiator union elbows, are specially handy for use in connection with radiators when only one valve is used. This union elbow enables one to easily connect and disconnect the radiator. Fig. 4, the eccentric reducing sockets, do away with the obstruction offered to the water by an ordinary reducing socket. The pipes come to rest on one level, thus creating a perfect clear waterway. Figs. 5 and 6, long twin tees, are specially suitable for water

connections, as can be seen from sketch. These long twin tees are so constructed as to avoid the friction the water sustains in an ordinary tee, thereby giving a far better circulation to the

FIG. 4.

FIG. 5.

FIG. 6.

water. To the already large assortment of first-class water and steam radiators as regards efficiency and design, Mr. Munzing has added another pattern (see fig. 7), which, being only

FIG. 7.

4½ inches wide at sections, is particularly suited for placing along the wall in narrow passages in offices, or wherever space is limited. The sections are connected by iron nipples forming a perfectly tight and durable joint. Mr. Munzing also keeps in stock a large assortment of American valves specially suitable for water and steam radiators, automatic air valves, automatic damper regulators, and tools and supplies for steam and hot-water fitters generally.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

BREACH OF BY-LAWS AT CROYDON.

AT Croydon on the 15th inst., Mr. S. Hurst, builder, was summoned at the instance of the Croydon County Council for using bad mortar in the construction of certain buildings in Elliott Road, Thornton Heath, contrary to the by-laws.

Mr. John Birch, building inspector to the corporation, stated that the defendant was building two houses in Elliott Road. The witness visited the buildings on January 30 and found that the material which was being used for mortar was garden mould mixed with lime. He told the foreman that he must not use that kind of material. The man explained that they had run short of sand, at the same time undertaking not to use that particular "mortar" again. The witness called again upon several occasions, and found that they were using coarse brick-kiln dust, garden mould and very little sand.

Mr. Thomas Walker, the borough surveyor, said he had the supervision of new buildings in the town. On January 31 he visited the works in question, and found very little mortar being mixed up. It was made chiefly from a heap of sifted garden mould close to the mortar heap, mixed with brick-kiln ashes and a little sand. The sand was most unsuitable, being too fine, and the material could not be called mortar. The witness went on to the building and found some of the bricks very inferior—the worst description of bricks, in fact—and he never saw work flushed up in the joints so badly. The witness told the foreman that better bricks and mortar would have to be used; but when he visited the building on Saturday last the same material was still in use. He should call the mortar a good imitation of mud. Good mortar, the witness said, should be composed of lime and good sharp sand, in the proportion of one to three, well mixed or compounded. The buildings were small double villas, to be let at a rental of 30% or 35% each.

The Chairman: Would the fact of the houses being built with this kind of mortar render them liable to be damp and dangerous to health? I have no doubt whatever that the dampness would come through as readily as through a piece of blotting-paper, and that in six years if the tenants drove a nail into the wall it would go in as easily as if the wall was composed of dry sand. The character of this building is the worst I have come across for many years.

The defendant's son said his father had built no fewer than 1,000 houses during the past thirty years, and he always used good materials. No doubt this work had been neglected

through his father's illness. He could not dispute the facts, however.

Mr. Bishop said that this was one of the worst cases he had ever heard of and was abundantly proved. The defendant would be fined 3*l.* 3*s.* and 2*l.* 9*s.* 6*d.* costs, or, in default of distress, twenty-one days' imprisonment.

The Town Clerk said he should require the defendant to pull down the houses from the top to the ground floor, or other proceedings might have to be taken.

RESTORATION OF SWANSEA CHURCH.

A SPECIAL vestry of the parish of St. Mary's, Swansea, has been held at the Old Church. The Vicar, in opening the proceedings, replied to some remarks which had been made as to the architectural value of the old building. He said that in the opinion of architects he had consulted there was no feature really worth preserving in the existing chancel, and if it came in the way of improvements it would be removed. The accommodation by the new plan would be 1,360 according to architects' estimates, which would mean easy accommodation for 1,500 persons, and the estimated cost was 26,000*l.* They had not as yet had any elevation or drawings of the proposed structure prepared. Alluding to the question of graves, the Vicar thanked the Morgan family for withdrawing their objections, and said that of the eighty graves within the area required they could only find representatives of eighteen, and these raised no objection.

Mr. Mason moved:—"That that part of the resolution passed at the vestry of July 21, 1892, authorising the Vicar and churchwardens to restore the church, be rescinded, and that they be now empowered to restore and rebuild the church on the plan now produced and explained by the Vicar, showing a nave 6 feet wider on the south side and 17 feet beyond the porch, and that the chancel be made 7 feet wider, the tower rebuilt, and the Herbert Chapel thrown open."

Mr. Philip Jenkins seconded.

Mr. J. Coke Fowler said the movement had his full sympathy and approbation, and he believed no difficulty could now interpose to prevent the excellent plan from being carried out.

The resolution was then put and carried.

Resolutions were afterwards carried decreeing that the application should be advertised, and that the work be not proceeded with for three months thereafter, and that the Mayor

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3½ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

be requested to appoint three gentlemen to co-operate with the Vicar and churchwardens in seeing that the necessary work in connection with the graves should be carried out with decency and reverence.

Lord Swansea has written the following letter about the proposal:—

"Dear Sir,—I must offer you many apologies for not sooner replying to your letter. No one can feel greater annoyance than I do at the destruction of the old parish church, in which I worshipped with my friends from my earliest childhood until I was twenty-eight years of age. I think it wholly unnecessary, as it is a sound substantial fabric and as large as is convenient for the congregation. If the Vicar is so ambitious as to desire to build a cathedral, and if the inhabitants of Swansea and the public at large are ready to find him 20,000*l.* or 25,000*l.* to indulge his ambition, so be it, so long as St. Mary's is not disturbed. In my opinion, such a sum would be better expended in building four or five churches of more moderate dimensions in various parts of this populous parish, if they are wanted. The desecration of 800 or 900 dead bodies, is, to my mind, hideous and revolting. They will be found in every condition of decomposition, from black mould with a few bones, which I have seen in a village churchyard, capable of removal only by the shovel, to bodies in every stage of decomposition too disgusting to describe, and that in the midst of a dense population such as surrounds St. Mary's. We living men ought to protect and not to desecrate the remains of the dead. I have no question that an injunction could be obtained to restrain and prevent such desecration, which I think would be a disgrace to our community. This was the substance of the letter which I wrote to Mr. Williams, which ought to have been read at the meeting. I also recommended the beautifying of the existing building.—Yours truly,

"SWANSEA."

PHOTOGRAPHY IN MINES.

At the meeting of the North Staffordshire Mining Institute, held at Stoke-on-Trent, Mr. R. H. Cole presiding, Mr. Herbert W. Hughes, of Dudley, introduced the subject of "Photography in Mines." He stated that the slides which would be shown on the screen might be called unique, because this was the first time a set had been prepared, selected from results obtained by several operators. Mr. Sopwith in 1881 and 1882 was the first to obtain a complete series of views showing various

operations from the bottom of the shaft to the working place, but nothing seemed to have been done further in this country until about eighteen months ago, when Mr. Burrow and himself took up the experiments and obtained photographs of mining operations where the excavations were larger than was usual. His own results were obtained in the 30-feet seam of South Staffordshire, and his first experiments proved that methods of illumination which were successful in comparatively thin seams were quite useless in the large chambers of the ten-yard coal. The electric-light magnesium ribbon and ordinary flash lamps had been tried with little success, and it was only on obtaining more powerful illumination that good results were obtained. He used a lamp in which magnesium powder was burnt in the oxy-hydrogen blow-pipe, the light produced being intensely brilliant and active from a photographic point of view. In order to shorten the exposure, plates of great rapidity should be employed and the lens should work with a large aperture. He was in favour of a light, portable camera with all the movements locked by spring catches, as the audible sharp click produced at the moment each spring acted was of great assistance in the semi-darkness underground, proving to the operator that the various parts of the apparatus were in their correct position. The difficulties to be overcome in mine photography were not many, but were hard to surmount. His experiments seemed to show that double the illumination was required in a coal-mine compared with a metal-mine. The condensation of water on the lens and plate was perhaps the most difficult matter to avoid. Mr. Hughes subsequently showed over fifty slides of pictures taken below ground in the Cannock Chase mines, Cornwall, South Wales, the South Staffordshire thick seam, Germany, and the United States.

H.R.H. THE PRINCE OF WALES, K.G., attended by Colonel Stanley Clarke, visited the Royal Aquarium recently, and after thoroughly inspecting the International Yachting Exhibition and excellent loan collection, viewed the performances of the Boxing Kangaroo, Adelina Antonio's daring descent, the remarkable divers, including Ben Fuller, and Mdlle. Bob Walters and the lions. H.R.H. was received and escorted by Mr. Josiah Ritchie (chairman and managing director), Mr. J. W. Wilkinson (secretary) and Mr. E. A. du Plat (organiser of the exhibition). By request of His Royal Highness, Mr. Ritchie conveyed His Royal Highness's thanks to the various artistes engaged.

THE INSANITARY CONDITION OF DUBLIN.

A MEETING of the Dublin Sanitary Association was held on the 15th inst., when the President said:—It is useless to attempt to conceal the fact that typhoid fever has made sad ravages in this city during recent years. I regret to find from statistics which have been kindly supplied to me by the Registrar-General, that there has been a very perceptible increase in the number of deaths from typhoid in Dublin in 1893 as compared with 1891 and 1892, and with the average of the ten years 1881-90. The number of deaths in the suburbs was, in 1891, 48; in 1892, 23; and in 1893, 42; and the rates were, for 1891, 4·6; for 1892, 2·2; and for 1893, 4·0. The public health committee, in their report, endeavour to show that typhoid is increasing in the suburbs as well as in the city proper. The figures I have quoted show that this is not the case. The undue prevalence of typhoid fever in Dublin is not denied by the public health committee; indeed, they are advised by the superintendent medical officer of health that "with the exception of St. Helens and Belfast, Dublin has the highest typhoid fever death-rate in the United Kingdom," and they appear to have adopted Sir Charles Cameron's view that the organisms which produce typhoid seem to have established themselves in Dublin and Belfast on the congenial soil afforded by low-lying, badly drained sites saturated with organic matter, and this has caused the disease to become endemic, as diphtheria has, within the last thirty years, become endemic in many European and American cities. This is certainly not a very agreeable view of the situation, and it is the duty of all who have the interests of the city at heart to bestir themselves, and see if some practical measures cannot be adopted to remove Dublin from the unenviable position which it now occupies amongst our great centres of population. I do not think that the inquiry committee have much reason to complain of the way in which the public health committee have dealt with their report. The public health committee regard as by far the most important part of the report that which refers to the drainage of the subsoil. They are probably right in this. There was one cause to some extent peculiar to Dublin, namely, the saturated condition of the subsoil, which appeared to afford special facilities for the growth and development of the organisms which are still generally believed to produce typhoid fever. I quite agree with the opinion expressed by a writer in the *Medical Press* of November 29, 1893, "That there exists the greatest doubt that subsoil saturation is the cause of the typhoid fever in Dublin,"

in the sense that it is the only cause. I am far from thinking that any one cause is responsible for the spread of the disease in Dublin; but I think enough has been said in the report to justify Dr. Reynold's opinion, and to make it incumbent on the Corporation to take some steps to put it to the test of careful and impartial experiment. *Apropos* of this subject of subsoil saturation, I hope some effort will be made to investigate the alleged waste of Vartry water by leakage into the soil. The city engineer denies that the waste occurs in the distributing mains, but I think it is quite clear that a great deal of waste Vartry water finds its way into the subsoil—whether from the mains or service pipes is immaterial for my purpose—and helps to increase the saturation of which we complain. In addition to their proposal that a system of subsoil drainage should be carried out in Dublin, the inquiry committee made several recommendations which I have not time to refer to at any length. It is of the utmost importance that urban sanitary authorities should be informed of every case of zymotic disease which occurs within their respective districts. The "Infectious Diseases Notification Act, 1889," was passed with this object, but unfortunately it is only an adoptive Act, and even where it has been adopted it is often allowed to become a dead letter. The inquiry committee suggest that efforts should be made to secure more complete returns of cases of typhoid fever under this Act, and that the townships should put it in force. The public health committee appeal to this association to point out to the medical profession in Dublin their flagrant disobedience of the law which, under a penalty, requires them to notify cases of infective disease. It is an admitted fact that there is no more certain source of typhoid fever than polluted milk. The testimony of many witnesses fully justify the conclusions of the commissioners, that cowsheds and dairies were situated in improper places within the municipal area, and that some of them possessed no adequate appliances for drainage, cleanliness and ventilation. This remark applied also to slaughter-houses, and is as true of the present state of things as when it was written, more than thirteen years ago. The condition of both dairy yards and slaughter-houses has constantly engaged the attention of the Council of this Association. The report on dairy yards, which is appended to the report of the inquiry committee, reveals the existence of a shocking state of things. It states that there are cow-yards which are a disgrace to the city and a source of danger to its inhabitants. The yards, as a rule, are kept in a condition of horrible filth; one of them is situated close to the

Corporation refuse dépôt in Marrowbone Lane, and others are under the very walls of our two large fever hospitals. As a rule the yards are unpaved, and large heaps of rotting manure are heaped up in corners. It was evident to the committee that the by-laws of the Corporation had not been enforced in the case of these yards, and they recommended that official registration and fortnightly inspections should be introduced, and that there should be compulsory closing of such yards as may be considered dangerous to the public health.

NOTTINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual dinner was held at the Spread Eagle Hotel, under the presidency of Mr. G. Fish. Amongst those present were Mr. Woodsend, ex-president; Councillors Wright and Skerritt; Messrs. Messom, Hodson, Williamson, Dennett, J. Shaw, Maule, H. Vicars, F. Fish, James Wright, J. H. Vicars, A. G. Bell, Gilbert, Gabbitass, R. Simpson, J. Cooper, F. Atkin, secretary, F. Messom, jun., Keeling, Pillatt, Barlow, Wartnaby, A. Huskinson, Brownell, &c. Mr. J. J. Adams occupied the vice-chair.

Following the loyal toasts, the Chairman proposed "Success to the Master Builders' Association." He felt that in accepting the office of president of the Association for the coming year he would, as far as lay in his power, promote the Association's interests in every possible way. There were many matters that were likely to be brought forward at their general meetings, and he would ask every master builder and every member of the Association to assist him by attending in good numbers, and giving their best advice for the benefit of the trade generally. There were several important questions that would require a great amount of study, both as regards the employers and those whom they employed; for instance, in regard to the general working hours of the trade. To his mind—and he did not know whether they would all agree with him—the present working hours of the trade were radically wrong. They had one class of men working at one time and another class at another time, and the fact was they did not know where they were. He hoped that during his year of office they would be able to bring about an arrangement whereby all their men would begin and leave off work at a regular stated time. That was a question of very great importance to the building trade of Nottingham, and he intended to raise it at the next meeting of the Association. He hoped that the schedule of prices would soon be put into force. The large gathering of members

that evening spoke well, he thought, for the future success of the Association, and he hoped that, with their ready help during the ensuing year, they would be able to improve the building trade, not only as affecting themselves, but also those whom they employed.

Mr. Woodsend responded, remarking that the success of the Association, in which they were all deeply interested, fully justified their high anticipations for the future. As their President during the past year, it had often been his duty to preside at meetings very scantily attended, and he could not help thinking that that was not the way to promote the success of the Association. To insure its success a certain amount of work, attention and thought were needed to be brought to bear upon its interests. Since its reconstitution, three years since, the Association had made very fair progress, its members had steadily increased and at the present time it had a substantial balance at the bank. He took it they were not combined for the purpose of accumulating funds, but it was satisfactory to know that the subscriptions came in very well indeed, and altogether the Association was in a prosperous condition. The question now before them was how they were to insure the success of the Association in the future? In Mr. Fish they had a very excellent president, and he was sure Mr. Adams would prove a very useful vice-president. He owed a debt of gratitude to Mr. Fish for the kind way he had assisted him during the past year, and his thanks were due to the members of the committee and also to Mr. Atkins, who had ever been ready to further the interests of the Association in his usual urbane and pleasant manner. He could wish that the trade of the town was in a better state than at present. As they all knew, they entered upon the past year with the hope that certain public works would be started in the town, but owing to the unfortunate coal strike and other circumstances, the money market had been made so difficult that the M. S. and L. Railway Company had had to postpone their proposed venture for some time to come. He hoped the delay would not be long protracted, because, when started, the work would give a good fillip to the building trade.

Mr. Vicars submitted "The Town and Trade of Nottingham," and Councillor Wright, in responding, alluded to the proposal to improve the river Trent for navigable purposes, and agreed that such scheme, if carried out, would prove very beneficial to the trade of Nottingham and district.

The annual report, which was then read by the Secretary, stated that the year just closed had still been marked by

general depression of trade, and continued:—"At the opening of the year it was hoped that new railway works and other public buildings proposed to be erected would soon be started and so give an impetus to the trades represented by the Association. But those works, unfortunately, were still in abeyance. Although the building trades generally had been quiet during the year, the officers of the Association had been actively engaged on one or two important matters which had needed all their acumen to settle satisfactorily. Perhaps the most important was the joiners' dispute in April last. The schedule of prices was still in the hands of the committee; as was also the apprenticeship question. The Association was now affiliated with the parent society of Great Britain. The numerical strength of the Association had increased and its finances were in a satisfactory condition. The death was recorded of one of the members, Mr. R. Dennett. The new members during the year numbered nine."

The Vice-Chairman proposed "The Visitors," to which toast Mr. Brownell replied.

REGISTRATION OF PLUMBERS.

EX-LORD PROVOST MATHEWSON presided at the annual public meeting held in Dundee in connection with the National Registration of Plumbers, and there was a good and representative attendance of master and operative plumbers and public representatives from various parts of the district, which embraces the counties of Forfar, Fife and Perth. The Chairman in opening the meeting laid stress on the fact that of late years more and more interest has been evinced by the foremost scientific men throughout the whole of Europe in questions relating to the public health, and he pointed out that whatever efforts scientific men and public authorities might make in the cause of public health would be in vain without good plumbing. Fortunately the public were now awakening to the vital importance of this question, and were heartily in sympathy with the movement for the registration of plumbers. The Secretary read the annual report of the district council, by which it appeared that the movement was making steady progress in the estimation of the plumbing trade and the public. Dealing with the question of the local plumbers' classes, the Council earnestly recommended that masters should take an interest in the attendance of their journeymen and apprentices at these classes, and that apprentices should have an attendance card to show

to their masters, and the hope was expressed that the time was not far distant when masters would make it a condition of apprenticeship that their apprentices should regularly attend the plumbing classes. Plumbers and others interested in good plumbing were earnestly recommended to support the Bill for the Registration of Plumbers now before Parliament. It was reported that evening classes for plumbers would shortly be opened at Perth. The Chairman presented a number of certificates granted by the Worshipful Company of Plumbers, London, to local plumbers.

Professor Matthew Hay, of Aberdeen University, occupied the chair at the last meeting of the Aberdeen District Council for the National Registration of Plumbers, of which he is the president. The results of the examinations for the prizes and certificates of merit offered by the Worshipful Company of Plumbers were reported and considered satisfactory. The date of this year's annual meeting in connection with the District Council was fixed for February 24, and it was decided that the prizes and certificates of merit won by the successful students and the certificates of registration granted to local plumbers should be presented at that meeting.

WATER SUPPLY IN LONDON HOUSES.

A LETTER from Mr. R. W. Edis, F.S.A., appeared in the *Times*, stating that the water company's inspectors declined to allow a three-gallon flush in some houses designed by him. Sir F. Bramwell, C.E., stated that a two-gallon flush was ascertained to be adequate by Lord Methuen's Commission. Some other letters on the subject appeared this week.

Mr. Edis wrote:—"I am quite aware that the regulations of 1872 provided for a two-gallon flush, which was doubtless at the time thought sufficient; but, to quote the words of the report of the special committee of the Sanitary Institute, published October, 1893, "It should be borne in mind that sanitary drainage was at that time (1872) little understood, and that there was little or no experience as to the amount of flush necessary in order to meet sanitary requirements," and "no evidence at all was given as to the amount of water the waste-preventers for closets should discharge in order to fulfil sanitary requirements."

I find from the report which I have quoted that, although in the majority of towns the regulations as to water-flush impose a limit of two gallons, the limit in Edinburgh is three gallons

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an **Enamelled Indicator**, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

and in Carlisle unlimited, and that the opinion of the special committee who drew up this report, after exhaustive tests made by them in the thirteen exhibitions held by the Institute during the past sixteen years, is "that the limit of the quantity of flushing-water to two gallons is very undesirable for any kind of closet, and altogether prevents the use of a number of excellent forms of valveless closets which are in accordance with the by-laws made by the London County Council under the Public Health (London) Act, 1891"; and after giving most excellent reasons as to the two-gallon flush not being sufficient in many cases to clear the closets, especially where the contents contain infection germs, they state emphatically that the minimum discharge should not be less than three and the maximum not more than three and a half gallons of water at each flush.

I am sorry that I, without intention, did the County Council an injustice, as from a letter received from Mr. Shirley F. Murphy, their medical officer of health, I find they have already moved for a three-gallon flush, and are in correspondence with the Local Government Board for an amendment of the water companies' regulations.

With regard to the particular case referred to in my first letter, the water company's agent insisted on the valves being taken out and two-gallon wastes substituted, the result being that the flush is utterly insufficient, and, in my opinion, dangerous to health, and at present there is no appeal from these insanitary and arbitrary regulations.

Mr. H. Saxon Snell writes:—A large majority of those who have interested themselves of late years in endeavouring to improve the sanitary arrangements of the Metropolis will regret that Sir Frederick Bramwell, by his letter published in your issue of the 16th inst., expresses an opinion that the regulation laid down twenty-two years ago by Lord Methuen's Commission as to the capacity of the flushing cisterns of water-closets should not, as is now proposed, be altered so as to provide a three-gallon instead of, as hitherto, a two-gallon flush.

Mr. Edis and Mr. Ernest Turner, two architects of considerable practice, have addressed you upon the subject urging the alteration, and inasmuch as these gentlemen, in common with myself and most other architects and engineers, have had bitter experience of the failure of the two-gallon system, the question is at least worth further investigation.

The population of London, according to the latest returns, is 4,306,411, and taking into consideration how many are infants or old, infirm and sick, it may be assumed that the proposed addition of one gallon of water each time a closet is used would

not amount in the aggregate to more than four million gallons daily. The cost of pumping this additional quantity could be but a fractional part of the cost of altering what Sir Frederick Bramwell calls the "uneconomical form of water-closet" at present in general use.

It has been clearly proved from the experiments lately conducted by the Sanitary Institute that wash-out or pan-and-trap closets of the best kind cannot be properly flushed with two gallons of water, and the only other form at present known that might meet the desire for more economical consumption is the valve-closet, but it has not been proved that two gallons is sufficient to flush even this expensive form of apparatus.

A valve-closet costs quite 2½ more than a wash-out or pan-and-trap closet; and assuming, therefore, that one apparatus would be required for each ten of the population of London, and it were made compulsory that this more expensive form should be generally used, the total additional cost to the rate-payers in London only would amount to no less a sum than 861,282½, as against the comparatively small annual outlay for extra pumping resulting from the proposed increase of the size of flushing cisterns. The conclusion is obvious.

Sir Frederick Bramwell calls attention to the fact "that two gallons of water occupies 3 feet 9 inches in length of 4-inch pipe, and is therefore a very adequate liquid piston for the clearance of that pipe." But he overlooks the fact that the soil-pipe of the present day is of a very different character to that of twenty-two years ago.

Then it was unventilated, and consequently the suction caused by the "liquid piston" he refers to not only cleared out the soil-pipe, but at the same time effectually unsyphoned every trap connected with it, the result being that after the water had left the pipe a regurgitation of foul sewage-gas occurred, which found its way into the buildings through the unsyphoned traps not only of the water-closets, but of the sinks, lavatory basins and cisterns, all of which in those days were allowed to pass into the soil-pipes.

Thanks, however, to the persistent efforts of sanitarians these ills are becoming things of the past, and the public are now fully alive to the absolute necessity of ventilating soil-pipes and otherwise preventing the introduction of sewer-gas into their dwellings.

The powerful and objectionable effect of the liquid piston in drawing off the contents of water-closet traps having thus been done away with, will not Sir Frederick Bramwell, on reconsideration, admit that a greater body of water is now necessary

to properly clear the soil-pipes, and will he say that the proposed minimum of three gallons of water per flush would even then be so powerful as the two gallons laid down under such different conditions twenty-two years ago?

Mr. C. Fitz Roy Doll writes:—Sir Frederick tells us that he assisted Lord Methuen's Commission twenty-two years ago in arriving at the conclusion that two gallons was ample. Was this conclusion arrived at after making experiments? If so, how is it that the Sanitary Institute, in its report dated November 1, 1893, after exhaustive experiments, condemns a two-gallon flush as totally inadequate?

If Sir Frederick Bramwell will read that report and examine the diagrams in it—or, better still, will go up to Parkes Museum and see the experiments—I have no doubt that he will admit that he made a mistake twenty-two years ago, which is not to be wondered at, as probably no science has made such rapid strides within the period named as that of sanitation.

Even if I take Sir Frederick Bramwell's statements with regard to Liverpool, Sheffield and Manchester as absolutely correct, it is no proof that two gallons are sufficient because the corporations of those enlightened boroughs allow that quantity.

With regard to the paragraph in which Sir Frederick informs us that "two gallons of water occupies 3 feet 9 inches in length of 4-inch pipe, and is therefore a very adequate piston for the clearance of that pipe," I can only express my surprise that Sir Frederick should use such a misleading argument.

He must know that the two gallons comes out of the flushing tank through a 1½-inch to a 2-inch pipe, and, therefore, it is impossible for it to act as a piston in a 4-inch pipe, inasmuch as the sectional area is as 1 inch to 4 inches, even taking a 2-inch flushing pipe, the largest ever used.

I scarcely think that the statement as to the 5,000,000 gallons of extra sewage per diem could be sustained upon investigation.

Many thousands of houses in London have had for years three-gallon flushing tanks, the notices for the removal of which, since the commencement of this agitation, has caused you, sir, to be overwhelmed with correspondence on this subject.

Furthermore, I maintain that in the better-class houses where two-gallon cisterns still exist the practice is to flush twice, whereby one gallon of water more is used than otherwise would be the case with a three-gallon flushing tank.

It may be true that "London already sins by its excessive

expenditure—not use—of water," but surely no one can call the use of water for sanitary purposes a sin.

Mr. E. Bailey Denton writes:—I was surprised to read Sir Frederick Bramwell's letter in your issue of to-day advocating the use of only two-gallon flushing cisterns for water-closets.

His argument that this quantity is sufficient may be, and probably is, correct in theory, but it is certainly incorrect in practice.

In London, at any rate, where I have had considerable experience, nine out of ten two-gallon cisterns do not in reality contain that given quantity of water; whilst in more cases than not it is impossible to place the cistern at such a height as to secure the head necessary to achieve the object aimed at. It therefore becomes advisable to increase the size of the cistern, and to allow a nominal flush of three gallons to remedy these drawbacks.

PARTY-WALL CASE.

AN award has been published in the case *Burkett v. Booker & Warne*, under the Metropolitan Building Act, 1855. Messrs. Booker & Warne, licensed victuallers, were pulling down the Daisy Public-house, Brompton Road, and gave notice of their intention to remove the party-wall between their premises and those of the adjoining owner, Mr. Burkett, a butcher. They intended rebuilding the wall and raising it to a greater height. Plaintiff claimed an injunction in the Chancery Division on the ground (as alleged) that a due party-wall notice under the Act had not been given by the defendants, who admittedly had not used the form approved and sealed by the County Council. The defendants, however, contended that the provisions of the Act had been substantially complied with, and this being so, it was not obligatory to use the usual form. Ultimately the plaintiff was advised to withdraw the objection, and by consent of both parties the Court ordered all questions including light and air to be referred to Mr. Thomas Batterbury, F.S.I., A.R.I.B.A., 29 John Street, Bedford Row, sole umpire, whose decision was to be final.

Mr. Frank Russell, counsel (instructed by Mr. George Clark, Gresham Street), appeared for plaintiff; Mr. H. H. Richardson, solicitor (of Messrs. Richardson & Carn, 2 Broad Street Buildings), conducted the case for the defendants.

Plaintiff claimed damages for disturbance in his business, including the expenses of his manager and family living away from the premises, which he contended were necessarily in-

THE MOST PERFECT AND RELIABLE SYSTEM OF

VENTILATION AND HEATING FOR

SCHOOLS, AND EVERY CLASS OF BUILDING.

The air of Class-rooms renewed every six minutes in all weathers positively and without draughts, no foul air anywhere; for a school of 1,000 68 tons weight of air impelled into it every hour. All buildings ventilated and warmed mechanically. No failures nor breakdowns.

curred, and 20% fees of his surveyor, Mr. Stephens, in relation to the party-wall. Mr. C. W. Stephens and Mr. Walter T. Farthing, surveyors, gave evidence on behalf of the plaintiff.

Mr. Richardson contended that the party-wall was unfitted for the purpose of supporting any new building, and that the expense of pulling down and rebuilding the wall should be borne by the building owner and adjoining owner in due proportions, under section 88 of the Act of 1855. Plaintiff, he urged, was not entitled under the Act to any compensation for disturbance, nor to his surveyor's fees; and he declared that the shoring and screening which defendants had done was sufficient, and indeed more than plaintiff was entitled to in law.

With regard to the question of light and air, both parties placed a statement of law before the arbitrator, who examined the witnesses as to this in the absence of the parties and on the *locus in quo*. Mr. James D'Oyley (defendants' architect), and Mr. Albert E. Pridmore, F.S.I., 2 Broad Street Buildings, were examined on defendants' behalf, and the proceedings, which lasted over a period of six days, terminated.

Mr. Batterbury has now published his award, finding that the party-wall was not suitable for the erection of new buildings adjoining it, and that it must be pulled down. The expense of pulling down and rebuilding he determined must be borne by the building owners (Messrs. Booker & Warne), but if the adjoining owner subsequently made use of the extra height to which the wall was raised, he is to pay his proportion in respect thereof. The arbitrator further found that the plaintiff's claim to rights of light and air in relation to the premises was unfounded, and must be dismissed, as also were the claims for compensation for disturbance and surveyor's fees. The costs of the proceedings before the arbitrator, as well as in the Chancery Division, were ordered to be paid by plaintiff.

SMOKE-PREVENTING FURNACES.

At the meeting of the Civil and Mechanical Engineers' Society a paper was read by Mr. G. R. Steward, M.I.M.E., on "Smoke-preventing Furnaces," with the object of showing the progress that had been made of late years in perfecting these appliances and the present position with regard to the "smoke nuisance," for the author was of opinion that there was every evidence that very strict legislation would soon be brought to bear in this direction. A description was given of different varieties of furnaces, particularly mentioning several of the more successful

of the modern smoke-preventing furnaces, such as the "Schomburg," the "Vicors," the "Hodgkinson" and others. Amongst these furnaces were sprinklers, coking stokers, and hand and automatically-fired furnaces. The author also referred to means of preventing smoke other than the expensive methods above stated, such as the mechanical adjustment of furnace doors, &c. Having had some years of practical experience in providing a means for the better prevention of smoke, it became very evident to the author that more was required than a sufficient supply of air, which was in many cases the only object aimed at, for although that is an all-important element, smoke when mixed with air in large quantities is frequently hurried away too quickly into the flues, and the gases from the fuel in consequence do not combine, and a smoky chimney is the result. It is therefore necessary to hold in check the progress of the gases and air until they are wholly and completely commingled and perfect combustion has been attained. After many trials, extending over several years, the author had the satisfaction of witnessing a practically smokeless chimney, and this result was arrived at by means of a new and simple smoke-preventing appliance, which will be worked from the furnace front without expensive machinery and without alteration in the construction of the furnace. This appliance is so arranged as to produce an eddy of air or baffle inside the furnace. It can be made to suit any furnace. This invention was not particularly described, as the patents for it had not been completed yet in Germany and France, but so soon as they are, the author stated that he anticipated a great success for his invention, and felt confident that it would meet with universal appreciation, and he said this after many years' experience with furnaces both on land and at sea, for in early life he had been an engineer on English, Russian and Italian ships of war.

THE LOSS OF SCULPTURE AT THE CHICAGO EXHIBITION.

THE fire which destroyed the Columbus arch, peristyle, music-hall and casino, has left the east end of the grand court open to Lake Michigan, and the observer standing in front of the administration building sees nothing, says the *Inland Architect*, to intercept the distant view but the statue of the Republic rising out of the water, which is now shown to better advantage than ever before. From this point no ruins are visible, for the

destruction was complete. The great buildings on each side still stand in all their pristine beauty and are not crumbling with the ravages of a wintry climate. A new perspective is now obtained and the court of honour takes on a new aspect, making it again an object of interest, notwithstanding the loss that has occurred. We have heretofore given the opinion that the Columbus arch, or water-gate, as it is officially called, was the most interesting structure architecturally (after the administration building) in the main group and the best of Mr. Atwood's works. It was such a monument that, if not preserved for as long a period as possible, ought to be reproduced in permanent materials. As the completion of the park will now be on a plan that will not be influenced by the location of the peristyle, there is a location where the Columbus arch could be reproduced with the grandest possible effect. It should be at the main entrance to the park from the midway plaisance, which is already a grand driveway, and serves the purpose for which it was intended, to connect Washington and Jackson Parks. As such a suggestion as this could not be practically carried out for many years to come, the realisation of one feature of the loss that has been sustained in the burning of the peristyle becomes stronger day by day. And that is the sculpture that adorned the arch. This consisted of the famous quadriga, representing Columbus in triumph in a four-horse chariot, which surmounted the top of it, the work of French and Potter, and the four groups of allegorical figures attached to the main piers of the arch, by Bela Pratt. In addition there were 128 statues on the pedestals of the main balustrades that surmounted the peristyle, music hall and casino, being enlarged reproductions of four figures modelled by Theodore Baur. All are gone for ever. There are no full-size moulds or models for any of these in existence except for the four figures by Baur. The quadriga and groups on pedestals were enlarged and built up from small models which fortunately are still in existence. It may be of interest in recording this loss to know that the quadriga cost the exposition 17,174 dols., which included the modelling by French and Potter of the groups of domestic animals with their attendants that were reproduced at the boat landings and are still in existence. The four groups modelled by Mr. Pratt cost 6,685 dols. So the loss of sculpture with the arch alone was 23,859 dols. The additional loss of the 128 figures on the peristyle, music hall and casino, represents an outlay of 17,520 dols. But these were all reproductions. However, it is worth recording, as showing the extent of sculptural adorn-

ment on the World's Fair buildings, that this fire destroyed what originally cost 41,379 dols. But the park commissioners have plenty more on hand. Around the basins and lagoons alone, without regard to the buildings, are the animal groups, by Kemys and Proctor, which cost 13,241 dols.; those of French and Potter, which cost 23,861 dols., and the Mac-Monnies fountain, which cost 50,000 dols., or a total of 87,102 dols. With the exception of the sculpture of the fountain these were all carefully painted and wrapped up to protect them from the weather before the park was returned to the custody of the commissioners.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 2441. Robert John Leggott, for "Improvements in apparatus for regulating fanlights."
- 2444. Benjamin Baines Dudley, for "Improvements in cantilever bridges, suspension bridges and similar structures."
- 2454. William Herbert Wainwright, for "A new or improved window-fastener."
- 2516. Edward Sydney Luard, for "Improvements in slam locks."
- 2528. Edward John How and Henry King, for "Improvements in sash fastenings."
- 2541. William Nolon, for "Improvements in the grooving of pulleys."
- 2576. George Justin Joseph Legrand, for "A new or improved domestic or other firegrate."
- 2594. Robert William Edlin, for "Improvements in valves."
- 2602. George Wright, for "Improvements in drawing instruments."
- 2663. William Joughin and Thomas Edward Jackson, for "An improved locking bolt and nut."

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor
T. Roger Smith, F.R.I.B.A., at University College, October 10,
1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

GOOLE.—April 16.—Competitive Designs invited for a Covered Market, with Shops fronting Boothferry Road and Estcourt Terrace, with a Board-room, necessary Clerks', Surveyors', Inspectors', Collectors', Gas and Water and other Offices, with the Necessary Anterooms, Storerooms and Lavatories, to be Erected upon the Land and Premises, in Goole, abutting upon the before-mentioned Streets. Mr. George England, Local Board Offices, The Exchange, Goole.

KINGSTON.—Suggestions invited for the Development of a Building Estate. The Secretary, Artisans' Land and Mortgage Corporation, 32 New Bridge Street, E.C.

KIRKCALDY.—March 17.—Plans, &c., are invited for proposed Beveridge Public Hall, Free Library and Adam Smith Memorial Hall, &c. Mr. W. Roy Spears, Town Clerk.

LANCASTER.—May 1.—Competitive Drawings invited for Extension of Markets, and Erection of a New Hotel. Mr. John Cook, A.M.I.C.E., Town Hall, Lancaster.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150l. and 50l., premium to merge. Mr. H. H. Hicknott, Town Clerk.

CONTRACTS OPEN.

ABERDARE.—March 6.—For Erection of a Memorial Hall and Church Club. Mr. A. P. Jones, Bute Municipal Offices, Aberdare.

ABERKENFIG.—March 3.—For Building Police Station. Mr. T. Mansel Franklen, Clerk of the Peace, Cardiff.

AMBERGATE.—March 2.—For the Erection of Five Cottages. Mr. James Williams, Midland Railway, Derby.

ANERLEY.—March 2.—For External Painting of District School. Mr. A. G. Hennell, Oakwood, Mayow Road, Forest Hill.

ANTRIM.—March 5.—For Building Lunatic Asylum at Holywell. Mr. J. Lanyon, Architect, Northern Bank Chambers, Royal Avenue, Belfast.

BERMONDSEY.—March 5.—For Supply of Ballast and Sand, Drain Pipes, Lime, Sewers' Ironwork, Ironmongery, Printing and Stationery, Portland Cement, Oilman's Goods, Coals, Shoeing Horses, Veterinary Attendance, Disinfectants, Scavengers' Brooms, &c. Mr. J. Harrison, Town Hall, Spa Road, S.E.

BISHOP'S STORTFORD.—March 5.—For Supplying Steam Cooking and Heating Apparatus at the Workhouse. Mr. Henry Baker, Clerk to the Guardians, Bishop's Stortford.

BLOXWICH.—March 12.—For Building Infants' School. Messrs. Bailey & M'Connell, Architects, Bridge Street, Walsall.

BRADFORD.—March 9.—For Building Engine-house, Engine-bed and Store-room. Mr. T. C. Hope, Architect, 27 Kirkgate, Bradford.

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.

All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW

BRENTFORD.—March 6.—For the Formation of a Promenade. Mr. J. H. Strachan, Clifden House, Boston Road, Brentford.

BRIGHTLINGSEA.—March 5.—For Improvements and Re-benching Chapel. Mr. Charles Pertwee, Architect, Bank Chambers, Chelmsford.

BRIGHTON.—March 8.—For Construction of Swimming-bath, North Road. Mr. Francis C. J. May, Borough Engineer, Town Hall, Brighton.

BRIGHTON.—March 29.—For Constructing a Concrete Groyne, Storm-water Outlet, and an Overflow Chamber on the Beach, opposite Western Street; for Constructing a Storm-water Outlet and Making Additions to the Existing Groyne on the Beach opposite the Old Steine; for Constructing about 980 Yards of Brick Sewers, 8 Feet in Diameter, 562 Yards of Brick Sewers of Smaller Dimensions, and certain Pipe Sewers. Mr. Francis J. C. May, C.E., Town Hall, Brighton.

BUCKHURST HILL.—March 3.—For Tar-paving the Playgrounds and Footpaths at Boys' Board School. Mr. E. Egan, Architect, Chigwell.

BUCKHURST HILL.—March 3.—For Enlargement of the Boys' Board School. Mr. E. Egan, Architect, Chigwell.

CAMBERWELL.—March 5.—For the Supply of Guernsey Granite, Kentish Rag, and Flint and Paving Stone, Lime, Cement and Tar Paving. Mr. C. W. Tagg, Vestry Hall, Camberwell.

CHERTSEY.—March 19.—For Building Infirmary and other Additions to Workhouse (confined to Local Builders). Mr. C. Welch, Architect, London Street, Chertsey.

CO. SUTHERLAND.—March 5.—For Construction of Three Harbours. Mr. James Barron, Engineer, 7 Union Terrace, Aberdeen.

FLEET, HANTS.—For Building Residence. Messrs. Ludford & Tulloch, Architects, 39 Victoria Street, S.W.

GLASGOW.—March 5.—For Works in Construction of Gate Lodges, Waiting-rooms, &c., at Botanic Gardens. Mr. A. B. McDonald, City Engineer, 64 Cochrane Street, Glasgow.

GRANGE-OVER-SANDS.—March 14.—For Building Three Villas. Mr. Stephen Shaw, Architect, Kendal.

HALIFAX.—March 5.—For Taking-down Old Buildings and Erection of Schools. Mr. Joseph F. Walsh, Architect, Waterhouse Chambers, Halifax.

HARWICH.—March 6.—For Building Board Schools, Boundary Walls, &c., Upper Dovercourt. Mr. J. W. Start, Architect, Cups Chambers, Colchester.

HEMSWORTH.—March 6.—For Supplying and Laying Pipe Sewers. Mr. Richardson, Surveyor, Imperial Buildings, Bond Street, Leeds.

HORWICH.—March 13.—For Building Cottage Hospital. Mr. Henry Shelmerdine, Architect, Hunt's Bank, Manchester.

HULL.—March 9.—For Supply of 12,000 Tons of Stone for Macadamising. Mr. A. S. White, Town Hall, Hull.

HYDE.—March 7.—For Building Fire Station. Mr. J. Mitchell, Borough Surveyor, Town Hall, Hyde.

ILMINSTER.—March 12.—For Extension of Grammar School and Girls' School, Fittings for Lavatory, &c. Messrs. Price & Wooler, Architects, Weston-super-Mare.

IPSWICH.—March 13.—For Building Girls' School and Additions to Infants' School. Mr. E. F. Bisschopp, Architect, 10 Museum Street, Ipswich.

KENDAL.—March 16.—For Additions to St. Thomas's Schools. Mr. Stephen Shaw, Architect, Kendal.

KENSINGTON.—March 8.—For Formation of Roads, Paths, and Airing Courts at the Infirmary in Marloes Road. Mr. T. W. Aldwinckle, 1 Victoria Street, S.W.

KIDDERMINSTER.—For Additions to House. Mr. J. M. Gething, Architect, Oxford Chambers, Kidderminster.

LEWISHAM.—March 13.—For Sewerage, Jobbing Works, Founder's Ironwork for Sewers, Tools, &c., and Horse Hire, as Separate Contracts; for the Supply of Horses, Harness and Carts for Dust Collecting in the Hamlet of Penge; for the Supply of Corn, Straw and Fodder; for Shoeing and Farriers' Work, and for Printing and Stationery. Mr. Edwd. Wright, Board of Works Office, Catford.

LEYTON.—March 13.—For Building Public Offices and Technical Institute. Mr. John Johnson, Architect, 9 Queen Victoria Street, E.C.

LLANELLY.—March 10.—For Building Town Hall and Public Offices. Mr. Wm. Griffiths, Architect, Falcon Bridge, Llanelly.

LLANISHEN.—For Building Infants' Wing to Schools, and Addition to Master's House. Messrs. Kempson & Fowler, Architects, 16 High Street, Cardiff.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208.
Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

LYMINGTON.—March 6.—For the Repair of the Cast-iron Outfall Sewer.—Mr. J. Davis Rawlins, 38 High Street, Lymington.

MELTHAM.—March 8.—For Additions to Oddfellows' Hall Messrs. John Kirk & Sons, Architects, Huddersfield.

NANTYMOEL.—March 21.—For Building Infant School. Mr. Jacob Rees, Architect, Pentre, Rhondda.

NELSON.—March 15.—For Building Sludge Press-House, Cake Stores, with Sludge Reservoir, &c. Mr. J. W. Bradley, Borough Engineer.

NEWBURY.—March 13.—For the Construction of the Sewage Disposal Works, viz. Precipitation Tanks, Buildings for Machinery and Appliances, Subsoil Drainage and Irrigation Carriers, Roads, &c., all at Lower Way Lane, also Buildings for Pumping Station, Engine-house, Pump-house, Office and Store, &c., with Roads and other Works situate at Newbury. Mr. John Anstie, 17 Victoria Street, S.W.

NEWCASTLE.—March 3.—For Supply of Building Materials for War Department Buildings and Property, for a Period of Three Years. Lieut.-Colonel G. Hildebrand, R.E., Newcastle.

NEWCASTLE.—March 13.—For Building Ten Residences. Mr. J. W. Dyson, Architect, 18 Grainger Street, Newcastle-on-Tyne.

PADDINGTON.—March 5.—For Execution of the Ordinary Day and Jobbing Works Required to be Performed in Constructing, Altering, Rebuilding and Cleansing Sewers, Drains, Gullies, Water-closets, Privies, &c., within the Parish. Mr. Frank Dethridge, Vestry Hall, Harrow Road, W.

PEMBERTON.—For Building Sunday School and Class-rooms. Mr. Richard Pennington, Architect, Clarence Chambers, Wigan.

PONTYPRIDD.—March 8.—For Building Seven Houses. Mr. T. Roderick, Architect, Ashbrook House, Clifton Street, Aberdare.

PUDSEY.—March 5.—For Building Twenty-six Through Houses. Mr. H. Hodgson, Architect, 27 Kirkgate, Bradford.

ROTHERHITHE.—March 6.—For Execution of Works of Sewerage and Drainage. Mr. James J. Stokes, Vestry Offices, Lower Road, Rotherhithe.

SALFORD.—March 15.—For Building School Board Offices. Messrs. Woodhouse & Willoughby, Architects, 100 King Street, Manchester.

SHREWSBURY.—For Restoration of St. Mary's Church. The Vicar.

SILLOTH.—For Building Infants' School. Mr. G. Armstrong, Architect, 45 Lowther Street, Carlisle.

SKIPTON.—March 2.—For Supplying and Laying Pipe Sewer, &c. Messrs. Barber, Hopkinson & Co., Engineers, Temple Street, Keighley.

ST. HELENS.—March 19.—For Supply of Materials for a Period of Twelve Months. Mr. Wm. John Jeeves, Town Hall, St. Helens.

147 STRAND, LONDON, W.C.

TRADE NOTES.

WE are asked to state that the amount of Messrs. Kelby & Gayford's tender for factory and stabling at Whitechapel was 6,684*l.*, and therefore 1*l.* above the tender accepted, not 29*l.* below it as announced in last week's issue. The figure 8 must have been mistaken for 5.

THE new offices for the Cheshire Lines Railway, Liverpool, are being warmed and ventilated by means of Shorland's patent Manchester grates, the same being supplied by Messrs. E. H. Shorland & Brother, of Manchester.

THE Grinnell Sprinkler is continually saving buildings in all parts of the world from total destruction by fire. The latest report comes from Tourcoing, France, where a fire started in the carding-room of the mills belonging to MM. V. Valentin et A. Flipo. Two Grinnell heads at once opened and extinguished the fire, the damage being insignificant. MM. Valentin et Flipo are highly pleased at the efficacy of the Grinnell Sprinklers, which were erected in their mills as far back as 1886.

AT the National Dental Hospital, Great Portland Street (Mr. A. E. Thompson, Leadenhall Buildings, architect, and Mr. J. Andrews, Mount Street, W., builder), the various works of heating, ventilation, hot-water supply, gas services, electric bells, cooking range, &c., have been carried out by Messrs. Russell & Co., 42 Berwick Street, Oxford Street, W. The heating is on the low-pressure system, with radiators and coils in the various halls, laboratories and rooms. The hot-water supply to the staff and students' lavatories, and to the various lavatories in the extraction and stopping rooms, is worked conjointly from the range and from a special hot-water supply apparatus fixed in the stoker's. For the ventilation, two main extraction-flues have been formed in the building, with cast-iron flue pipes from stoker's carried up in each, into which flues from the various rooms are carried, and these are all fitted with Russell's atmospheric gas gill extractors for summer ventilation. The fresh-air inlet tubes are of cast-iron and to special design. The staff and patients' w.c.'s are also ventilated into a separate flue fitted with powerful extractor.

AN accident is reported to have occurred at Messrs. Ashton, Frost & Co.'s foundry, Blackburn. Men were engaged in hoisting a large iron plate in the drying-shed when the crane collapsed, and in falling dragged away the supports of the roof, which fell in. A large quantity of iron was stored on the roof,

and a number of men were buried under it, three of them being injured.

NOTICES have been given to the steel and tinplate workers at the Pontymister Works to terminate contracts on Saturday. The dispute has arisen through the Scotsmen and North of England workmen having refused to continue the work of rolling steel bars, and upwards of 1,000 workers are affected. Serious riots took place at these works two months ago, owing to a collision between the Scotsmen and Welshmen.

THE Barton Rural Sanitary Authority have accepted the tender of Mr. Robert Lomax for the execution of No. 1 and 3 sections of the Irlam and Cadishead main drainage works.

BUILDING AND BUILDERS.

STEPS are still being taken for the restoration of St. Michael's Church, Linlithgow. The church is one of the finest specimens of old ecclesiastical architecture now existing, and the desire for complete restoration has been felt for many years. A fund of something like 3,000*l.* has been provided by donations and subscriptions already.

THE report of Sir A. W. Blomfield, A.R.A., on the disaster to the chapter-house of Chester Cathedral in the gale of Sunday, the 11th ult., has been considered by the Dean and Chapter. They have decided to make safe the exquisite groining of the inner roof, which has been much shaken, and also to complete the western gable and roof, as the late Sir Gilbert Scott had advised. For this work it is hoped that 1,000*l.* will suffice, and as there is no fabric fund to meet such expenditure the Chapter will have to appeal to the generosity of the public.

THE post office at Carnarvon is to be considerably enlarged by the addition of the dwelling-house which forms a part of the building. The contract, which involves an outlay of several hundred pounds, has been let to Mr. Watkin Jones, Bangor.

THE present Stamford Workhouse has been condemned by the Local Government Board as inadequate and insecure. The Stamford Board of Guardians, at their fortnightly meeting, decided to defer the consideration of a new workhouse for six months. The matter has been before the board for three years. It was stated that the present house is very overcrowded.

TELEPHONE 804.

OFFICES for the Keighley School Board have been erected in Cooke Street and Lawkholme Lane, Keighley, from the designs of Mr. J. Ledingham, F.R.I.B.A., of Bradford.

At the meeting of the Glasgow Dean of Guild Court, a letter was read from Mr. John Whyte, Master of Works, directing attention to the dangerous condition of many chimney-heads in the city, especially those on the front and back walls of tenements. A number of these were blown down by the late storm, and several persons were seriously injured, although fortunately no lives were lost. The Lord Dean suggested that proprietors and factors should carefully examine such chimney-heads, and in cases where there was no support it would be well to put an iron stay; or, better still, an iron ladder, which would be a convenience to sweeps, and would also prevent chimney-heads from being blown over.

VARIETIES.

THE Sheffield Trades Council have passed a resolution in favour of the Corporation subscribing 100,000*l.* towards the limited company which has been formed for the purpose of constructing a central railway and connecting lines in Sheffield, at an estimated cost of a million and a half. The erection of the new station would necessitate the clearing away of one of the most unsanitary districts of the city.

At a special meeting of the Severn and Wye Railway Company, it was unanimously decided to sell the line to the Midland and Great Western Companies for 477,000*l.*

JOHN OAKEY & SONS, Limited, have been able to declare a dividend of 10 per cent. on last year's business, which is a satisfactory testimony of good management.

A SUM of 1,000*l.* having been subscribed towards a memorial of the Bishop of Winchester's episcopate in the diocese of Rochester, it is proposed to devote the money to the erection of stalls, designed by the architect, Sir Arthur Blomfield, in harmony with the beautiful choir of the church of St. Saviour's, Southwark.

THE annual salary of Mr. A. R. Binnie, the chief engineer of the County Council, is at present 1,500*l.*, and on the recommendation of the general purposes committee the amount

will be increased to 2,000*l.* They also recommended that the salary of Mr. Shirley F. Murphy, the Council's medical officer of health, should be raised from 1,000*l.* to 1,250*l.* per annum.

A LOCAL GOVERNMENT BOARD inquiry has been held at South Wingfield to consider an application of the Belper rural sanitary authority for a provisional order for the compulsory purchase of 5 acres of land for waterworks purposes. Mr. W. H. Radford, C.E., of Nottingham, is the engineer to the scheme. It is proposed to take water from certain springs and brooks, and construct filter-beds and service reservoir, with the necessary iron mains to supply South Wingfield with water.

THE water committee of the Carlisle Corporation have agreed to recommend a gravitation water scheme for the city, at a cost of about 110,000*l.* At present Carlisle is supplied with water from the river Eden, collected in filter-beds on the Steney Holme, close to the town, and thence pumped to the consumers. The water is abundant in quantity and excellent in quality, but the pumping machinery, which has been in use for many years, is said to be worn out, and inadequate for modern requirements.

THE Parks Committee of the County Council propose to expend 6,000*l.* in laying out Hackney Marshes, and in constructing embankments, watercourses and bathing-pools.

GLENBURN Hydropathic establishment, built at a cost of 35,000*l.*, to replace the building destroyed by fire in 1891, has been reopened.

STEPS are being taken to build a new church at Rugeley in place of the old structure.

NEW CATALOGUE.

THE catalogue of Messrs. B. Ward & Co., of 15 Great George Street, Westminster, of patent fireproof floors, will interest many of our readers. The system is designed to secure fireproof floors that are also sound-proof, and in addition ventilated. Among the specialties referred to and illustrated are fireproof casings for columns, stanchions, &c.; damp-proof and sound-proof slabs for walls, concrete slabs for curing damp in basements, grooved and channelled granite concrete paving for stables, &c.; fireproof staircases, granite concrete flooring for buildings, &c., and general concrete work.

GOEHRING PANELS.

By means of an improvement in their ingenious machinery, Messrs. J. M. Bennett & Sons, Ardwick, Manchester, are now able to produce panels as well as mouldings. The examples we have seen show that the hardest oak as well as pine can be employed. This extension of the process is an advantage, for it enables a series of sunk mouldings as well as geometrical ornament to be produced, and the bareness of panels will therefore be obviated. It is needless to say that the same good taste is seen in the new application as in the mouldings, picture-rails and casing for electric wires, which hitherto have made "Goehring" familiar to all architects and builders in this country. The new panelling is an improvement which has been desired for many years, but hitherto the impediments appeared to be insurmountable. It could hardly be produced at a more opportune time, for the value of woodwork is now recognised, and the Goehring panels can be adopted in cases where the wood is left in its natural state or varnished or painted.

PUMPING MACHINERY.

At the meeting of the Birmingham Mason College Engineering Society, under the presidency of Professor R. H. Smith, a paper was read by Mr. Edward C. R. Marks on "Pumping Machinery." The author fully traced the development of such machinery from ancient water-raising appliances, as employed for centuries prior to the introduction of the common suction

pump, to the most modern type of steam-pumping engine for waterworks service. The limit of suction lift was discussed, and details given of the power of men in pumping. The first application of steam for the purpose of pumping as applied by Savery for the Cornish mines was illustrated, as also the development of such application by Newcomen and Watt. Full details and particulars of tests were put forward concerning the Worthington pumping engine, from the smallest size, as employed for boiler feeding, to the largest types, in which, as was shown, when fitted with compensating cylinders, enabling the steam to be expanded to the utmost useful ratio, the duty obtained in actual pump energy amounted to upwards of 114 million foot-pounds per one hundredweight of coal, a result that fully equalled or surpassed anything obtained with crank and fly-wheel engines of the most refined type.

SURVEYORS AND AUCTIONEERS' CLERKS' PROVIDENT ASSOCIATION.

THE number of members has again increased. The second quinquennial period has now closed, and the accounts will shortly be in the hands of the actuary. As compared with the close of the first five years the membership is as follows:—

	Dec. 31, 1888.	Dec. 31, 1893.
Sick Allowance Fund ...	33	71
Life Assurance ...	25	35
Superannuation ...	10	13
Benevolent... ..	7	5

During the past year three members have withdrawn from the Association and one has died. The important alteration made in the life assurance division has resulted in the issue of new policies and the increase of old policies to the amount of 800/. No claim has yet arisen in respect of this fund. The management expenses and the claims on the sick fund have again been nearly covered by the interest on investments. A further sum of 100/. has been added to the invested funds, raising the total amount to 2,800/. The committee mentioned in their report last year that they were endeavouring to raise an annuity fund for an aged member of the staff of a City firm. After careful inquiry they felt justified in voting 25 guineas from the Association Benevolent Fund, and with other generous subscriptions a total sum of 186/. was raised. The greater part of this was devoted to the purchase of an annuity. The Association is administering the balance for the benefit of the annuitant, but apart from the general funds.

AN IRISH VETERINARY COLLEGE.

IT is announced that the Government will ask Parliament to authorise the grant of a sum of 15,000*l.* as a contribution towards the cost of acquiring suitable buildings and fittings for a Veterinary School of Medicine in Ireland. The college is to be under the control of a board of governors, one of whom shall be president and one treasurer. The governors shall be nominated in part by the Crown, in part by the Royal Dublin Society, the National Board of Education and the subscribers. From the governors shall be selected an executive committee under the name of "The General Purposes Committee," to whom will be entrusted the framing of by-laws for the government of the college and all matters relating thereto.

The college buildings will consist of:—1. An official residence for dean or resident veterinary officer. 2. Infirmary for sick animals. 3. Operation theatre. 4. Lecture-rooms. 5. Chemical, physiological and bacteriological laboratories. 6. Museum and library. 7. Dissecting-room. 8. Board or committee-room. 9. Professors' room. 10. Classroom for students.

IMPROVEMENTS IN EDINBURGH.

AN agreement is likely to be arrived at between the Corporation of Edinburgh and the North British Railway Company concerning the widening of the North Bridge and other improvements around the Waverley Station. The Lord Provost's committee consider an opportunity such as is not likely to occur again has now arisen for rebuilding and widening the North Bridge under favourable circumstances. These circumstances are—(1) That a large contribution in money and numerous valuable concessions in favour of the Corporation may now be obtained from the North British Railway Company; and (2) the company are about to proceed with the extension and reconstruction of the Waverley Station, and there are strong reasons of expediency for rebuilding the bridge concurrently with that work. The committee of the House of Commons unanimously expressed their strong opinion in favour of the bridge being rebuilt concurrently with the reconstruction of the station as being in the interests of both the Corporation and the Company, and the Corporation might be placed in an unfavourable light before Parliament if they disregarded such a recommendation. (3) If

the present opportunity is not taken, the Corporation will, on a future occasion, probably not remote, require to undertake the work at a very much greater cost than at the present time, and under difficulties and disadvantages which can now be avoided. Further, the public would probably suffer from an inconvenient station and a less efficient railway service. (4) To get the full advantage of a new and widened bridge it is necessary to carry on the widening all the way up to the High Street. This would effect a great public improvement, and can be done at a comparatively moderate cost. The company now offer the contribution of a fixed sum of 30,000*l.* towards the cost of the bridge. That is one-third of the total estimated cost, and is a large increase on the amount which they had first proposed.

Among the terms stipulated for by the North British Railway Company as the condition of leaving the site occupied by the buildings on the north-west corner of the North Bridge unbuilt on are:—(1) The company ask the Corporation to convey to them, free of charge, the space under the northern arches of the bridge, for which the Corporation at present get a rent of 125*l.* per annum. (2) They ask the Corporation to convey to them, free of charge, the following subjects, which might be taken under the compulsory powers of the Waverley Station Act, 1891, on payment of compensation, viz:—The fish market in Macdowell Street, extending to 1,200 square yards, with the buildings thereon; a piece of ground adjoining Regent Road, east of the Calton Prison, and opposite the gasworks, extending to 735 square yards; wayleave for tunnel at the east of Regent Road, extending to 565 square yards; a piece of ground at Regent Gardens, further east than the tunnel, extending to 990 square yards; a piece of ground at the corner of Cranston Street, 340 square yards; and the area of certain streets, which would be closed. The company also ask the Corporation's consent to Parliamentary sanction being given to certain relaxations of restrictions and servitudes affecting the station. It likewise appears that the company ask to be relieved of the obligation, before stopping up Cranston Street, "to construct and thereafter to maintain and light a subway for foot passengers at that street;" and they further ask the Corporation to discharge certain claims without payment, including claim for the temporary occupation of certain ground in East Princes Street Gardens; claim under the Act of 1891 for the expense of screening and planting the railway in Princes Street Gardens; and claim for wayleave for tunnel under Torphichen Street Police Station, if the Corporation agree to grant wayleave.

PORTSMOUTH DOCKS.

ALTHOUGH the excavation of the new docks, Nos. 14 and 15, at Portsmouth has been resumed, the work is making only slow progress, being confined to the heads, in consequence of the inflow of water from the repairing basin through the open entrance of No. 15. The entrances were constructed at the same time as the extension works, and are identical with the entrance to No. 13, with the exception that, owing to the satisfactory nature of the ground, the piling in the foundations has been omitted, the sheet piling in front only being retained. The entrance to No. 14 is closed by a caisson, and until the other entrance has been similarly blocked, the excavations cannot make much headway. As originally designed, the distance between Nos. 14 and 15 was 210 feet, and the new docks were intended to be of the same size and description as No. 13. It is now proposed to increase their length to 600 feet, but without making any practical increase in their breadth. The estimated cost of the two new docks is 310,000/.

WINTER GARDENS PAVILION, BIRMINGHAM.

THE Winter Gardens Pavilion, abutting on the Old Square, Birmingham, was reduced to ruins on Sunday night by the violence of the wind, which had been increasing in force from sundown, and became very boisterous between nine and ten o'clock. The pavilion, which was constructed mainly of glass, wood and corrugated iron was in course of demolition, the materials having been sold to a local contractor in order that the site might be cleared preparatory to the erection of extensive business premises by a wholesale drapery firm. A number of sheets of corrugated iron forming portions of the roof and sides of the building had been removed, and this circumstance was no doubt accountable for the disaster of last night, the wind thus admitted exercising immense force on the hollow structure which remained. At about twenty minutes past nine,

says the *Birmingham Post*, there was a terrible crash as the sides gave way and the roof collapsed, and the greatest alarm was created in the neighbourhood, the thunder of the falling timbers being heard for a considerable distance. It was at first feared that the caretaker of the building was buried in the ruins, as he had been seen to go in at the main entrance shortly before the catastrophe. After a moment of suspense, however, he emerged into the Old Square, having happily been warned of the approaching danger just in time to enable him to effect his escape. The scene was one of utter chaos, all the supports of the building having given way, and let down the glass and iron roof bodily. Fortunately everything had been cleared out of the interior, but the damage to the material of which the structure was composed must be considerable. In view of this untimely dissolution of what was till quite recently a popular resort of pleasure-seekers, it may not be uninteresting to recall some of the vicissitudes through which it has passed during its brief but chequered history. The iron pavilion known as the Winter Gardens was opened on Boxing Day in 1890. It was intended as the forerunner of a permanent structure on the plot of ground leased from the Corporation by the Winter Gardens and Hotel Company. The company, however, did not receive the support that was anticipated for it, and the Winter Gardens portion of the scheme was indefinitely postponed, while the adjoining block, consisting of an hotel and shops, had to be completed on a less ambitious plan than that originally proposed. Efforts were made to promote the popularity of the pavilion by means of promenade concerts and industrial trade exhibitions, but these attempts, however, only met with partial and passing success, and the company were glad to let the place for a skating-rink. During this phase of its history Sunday evening promenade concerts were given, and a somewhat ludicrous attempt was made to protect these against the provisions of the Lord's Day Act by combining with them a short address, and so investing the concerts with the character of a religious gathering. A preacher was advertised for, but no one responded to the invitation, and the manager had to mount the rostrum himself. These and other ingenious enterprises failed to make the rink a success. A much more ambitious scheme was that of "Venice in Birmingham." The conversion of the pavilion into a miniature Venice, with canal, gondolas and other characteristic adjuncts, made the Winter Gardens, with the aid of a series of concerts and conjuring and other entertainments, a very popular resort for some time. Eventually, however, the place was dismantled,

and for some time past it has been in the hands of the Corporation, who, as the ground landlords, found it necessary to resume possession of the site and take over the buildings. During the gale of a fortnight ago a portion of the building had to be removed by the Fire Brigade for the safety of the public.

BUILDING LINES IN MIDDLESBROUGH.

A SUMMONS was taken out by the Middlesbrough Town Council against Mr. J. S. Scott, builder, for disregarding the third section of the Public Health Act, 1888, when erecting buildings on his own land. The case was heard by the stipendiary, Mr. C. J. Coleman. The Town Clerk stated that Mr. Scott was the owner of a plot of land which had a frontage to Linthorpe Road of 100 feet, to Southfield Road of 154 feet and to Wilton Street of 100 feet, and the plot contained 1,752 square yards. On this plot were three wooden structures—one occupied as a cobbler's shop, one as a fancy goods and tobacconist's shop, and one as a confectioner and tobacconist's shop. The first-named of those structures, he understood, was built in 1874, but that was contrary to the information given to him when the summons was issued, and as it could not, therefore, be affected by the Act, he asked the Court to allow him to withdraw that summons. The other two buildings were erected in 1891 and in October, 1893. The Urban Sanitary Authority claimed the right to require all buildings situate in Southfield Road on the south side up to Palmerston Terrace to be set back 70 feet, and that all buildings on that portion of the east side of Linthorpe Road to be set back 30 feet. If these set-back lines were carried out it would reduce Mr. Scott's plot for building purposes to 404 square yards; but he submitted that Mr. Scott became owner and took possession of the land with a full knowledge of the requirements of the Urban Authority as to set-back.

Mr. Parrington contended that a very great hardship would be done to Mr. Scott if the Corporation were allowed to enforce this set-back. There was no proof or allegation that their maintaining those buildings was any detriment to the public health, and the only other question he could conceive was the question of uniformity. He submitted that there had been no uniformity with regard to the line of buildings in Linthorpe Road, and he was driven to the conclusion that the Corporation were acting in an arbitrary and capricious manner towards Mr.

Scott. If the Corporation wanted the defendant to alter and set back those buildings they must compensate him, and the question of compensation was clearly provided for by the Public Health Act. He hoped his worship was not going to allow the Corporation to take away 1,300 yards of Mr. Scott's land without compensation. In conclusion, he pointed out that the Corporation had all along been receiving their rates until December 1893.

Mr. Bainbridge, in reply, said the Corporation were bound by the poor-rate book to rate those places. As to dealing with houses built at different distances, and having different set-back lines, the Corporation had no power to deal with those houses until the Act of 1888 was passed.

The Stipendiary said it was an important case, and he would take time to consider his decision.

THE TEMPLE OF PHILÆ.

"A CIVIL ENGINEER," writing to the *Times*, says:—Will you allow me to give some reasons for supposing that the resolution passed on Friday last by the Society for the Preservation of the Monuments of Ancient Egypt is founded upon incorrect or insufficient information and their fears are groundless, because it is possible that the alarm excited by the supposed destruction of the Philæ temples may raise opposition to the Assouan Reservoir, which is otherwise admitted to be the best possible irrigation scheme for Egypt?

The resolution assumes, without evidence, that if Philæ is submerged for some months each year the celebrated temples, which are unique for beauty and of the highest historic evidence, will be destroyed.

It is well known that the temples in themselves are not remarkable, either from an architectural or archaeological standpoint.

They are late Ptolemaic copies of an earlier style, and their unique beauty, as seen in the distance on the lovely Osiris Isle, depends mainly on the site and its surroundings. It is undoubtedly the most beautiful spot in Egypt; it seems more like the creation of a painter's fancy than an actual scene.

It is only when landing on the island that the beauty vanishes; we are disillusioned and disappointed to find that the whole island, including the avenues, colonnades and court-yards of the temples, has been covered with filthy mud-built dwellings of the later Coptic Christians, which not only dis-

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

figure the place and hide the beauties of the temples, but make exploration difficult and tedious.

The temples themselves are so solidly built out of cut granite, face to face, with little mortar, on solid rock foundation, that were the whole island to be submerged for some months every year they would not be injured in the slightest degree. Quite otherwise, the water would dissolve, level, and partly carry away the mud hovels that now disfigure the place, and which would have been removed long ago could money have been found to pay for the labour.

It might reasonably be supposed that the action of the Nile water would wear away the finely-cut stonework in the temples, but any apprehensions on this score will be removed by examining the stone walls that protect the island while they are exposed to the full current of High Nile. Although they have been washed annually with the rising waters for about two thousand years, the stonework still shows the marks of the masons' tools and, in fact, looks so fresh that one might suppose that the wall had been recently built.

This being so, it is fair to suppose that the temples would suffer no more. In my opinion, the island would be greatly improved in cleanliness and beauty, and during the winter months the arid, dusty waste of crumbling mud-dwellings which now exist would be replaced by a beautiful garden, and parts of the temples that for want of funds cannot now be excavated might then see the light.

The island would be submerged during the months from May to September. The number of unofficial Europeans who travel up the Nile past Philæ at this period do not average one per month. Their loss would be compensated by the fact that during the tourist period the island would appear clothed with verdure, and far more beautiful than it does to-day.

It seems to me, therefore, that these frequent petitions about the island of Philæ are a "much ado about nothing." I would suggest that the Society for the Preservation of Monuments waive their objections to this scheme, provided that due care is taken to protect the temples, and that the island is laid out as a public garden.

Possibly they might get some *quid pro quo*, such as a larger grant for the preservation of ancient monuments, so that the necessary works for preserving the Karnak Temple and the tombs near the big pyramid and those of Sakkara may be carried out and maintained with efficiency.

Cordially as I sympathise in the main with the views of the

Society for Preserving Ancient Monuments, I think I have shown some reasons for differing with them about Philæ, the sacred isle "where the god sleeps" "whom it is not permitted to name," and whose attribute has ever been that he supplies Egypt with life-giving streams of pure water. A propitious omen.

Mr. W. J. Loftie in commenting on the above letter says :— There are no granite buildings on the island of Philæ, and an annual submergence would probably in about three years wipe out the two temples and the very interesting and curious early Christian remains at present scattered over the whole island. There is one point of some importance which I have not seen mentioned. The rocky islets in the Cataract, and especially those close to Philæ, are inscribed with hieroglyphics relating to kings of dynasties as early as the eleventh, while on the adjacent shore north of Mahatta a long valley is simply filled with similar inscriptions dating from the twelfth dynasty to the nineteenth. All these would, of course, be submerged, and after a season or two would, no doubt, be obliterated. Most Egyptologists, I think, are more anxious about Sehayl and Konosso and the writing in the quarries than about Philæ itself, and students of Christian antiquities think of the scarcely-explored remains of perhaps half a dozen Christian chapels, dating back to the second and third centuries of our era.

THE BUDA-PESTH TRAMWAYS.

THE electric lines in Buda-Pesth have been built and equipped by Messrs. Siemens & Halske during the past five years, along four of the principal tramway routes of the city. So far as the street surface is concerned, they do not show any striking difference from ordinary street tramways operated by horses. There are no poles or span wires across the streets, from which the electric conductors are hung in the "trolley" system, nor is there a third rail or a third grooved slot. There are simply two rails for each track, upon which run the car-wheels as on ordinary lines, and these are not employed in any way as part of the electric circuit for conveying current. The latter travels to and from the motor-cars along conductors in an underground conduit or channel made of concrete, and carried underneath the whole length of one rail of the track, The interior of the conduit is egg-shaped, 13 inches high and 11 inches wide in the clear. At distances of 1·2 mètres apart

SPECIALTIES:

GROOMBRIDGE'S Patent SELF-ADJUSTING BRACKET,

For Seats, Shelves, Tables, &c. Specially adapted for use in Churches, Chapels, Schools, Theatres, Public Buildings, Trams, Railway Carriages, Steamships, Yachts, &c.

LIST OF PRICES.

	Each.
8" 10 1/2" 12" 14" 16"	
Iron	6/6 7/6 8/6 9/6 10/-
Brass	10/- 12/- 14/- 16/- 18/-

The Advantages of this Patent Bracket are that it can be raised or lowered by the action of only one hand. It is automatic and perfect in action, and the extreme simplicity of its arrangement prevents any possibility of its getting out of order.

PRESTON'S Patent SCREW ADJUSTMENT,

For opening, closing, and securely fastening Fanlights, Casements, Skylights, &c.

A749 1/2-inch Rod x 18 inch.	each
All Brass	11s. 6d.
Brass Wheel, Iron Fittings	10s.
A866 3/4-inch Rod x 12 inch.	each
All Brass	8s.
Brass Wheel, Iron Fittings	7s. 6d.

This thoroughly efficient Screw Adjustment provides for opening, closing and securely fastening Fanlights, Casements, &c., and will by its extreme simplicity commend itself to Architects, Builders, &c.

Working Models of the above and other Specialties may be seen at our new Show-rooms, 57 HOLBORN VIADUCT, E.C. Architects and Builders are invited to inspect same.

(say 3 feet 10 inches) cast-iron frames of square shape are embedded crossways in the concrete. These frames have ribs or flanges 7 inches broad of a profile similar to the concrete channel, and they serve not only to strengthen the latter, but also as supports for the rails. The conductors, along which passes the current for the cars, are fastened to these flanges through the medium of suitable insulators. The bottom of the interior channel is about 2½ inches below the level of rails. The width of slot or distance between the rails—for access to the conduit channel and conductors—measures 15-16 inch. This width has been chosen so as to allow the flanges of the wheels to pass easily around curves, and is the same as that used in ordinary rails. If the electrical connection only had to be considered, this width could have been materially reduced. The current conductors of angle iron are led along the sides of the conduit channel, being fastened, as already stated, to hollow insulators; one conductor serves as the lead, the other as the return. They both lie directly underneath the rails, and, therefore, cannot be seen or touched from above; and they are fixed sufficiently high above the channel bed to prevent contact with any water that may drain through or lie in the channel. Sumps are provided at intervals to collect and retain such water and mud as may find access to the conduit, the overflow passing into the street sewers. There is no difficulty about this, nor any danger of water backing up from the sewers, as the base of the channel foundation does not exceed at any point a total depth of more than about 2 feet 4 inches from rail and street level. The second rail of each track might, of course, be of any desired section, since there is no conductor or conduit underneath. For instance, a flat rail could be used, and in such a case each track would have but one groove in the street surface, an undoubted advantage.

The cars do not outwardly present any different aspect to that of any ordinary street railway car; they have no draw-bar arrangement at the ends, but on the top of each under-frame sill is a buffer, which also serves to carry a coupling to allow of a trail car being attached. The car motor is placed in a closed casing between the two car axles; a system of double chain-gear is employed to reduce the speed ratio, driving on to one of the car angles from the motor spindle. The line potential is maintained at a pressure of 300 volts, and contact is made with the angle-iron conductors in the underground channel by means of a travelling contact piece attached to each car. A number of cars are able to run upon the same track independently of one another, and in different directions.

The entire network of lines is operated by current supplied from a generating station situated almost centrally. In the boiler-house are erected five water-tube boilers, each having a heating-surface of some 325 square feet. Of these, three are in regular use, leaving one to act as a reserve, whilst the fifth is being cleaned and repaired. The engine-room contains three 100 horse-power steam-engines, each of which drives a dynamo of corresponding output by means of hemp ropes, and three 200 horse-power steam-engines coupled up direct to large dynamos of ring type. These latter sets have been added lately in view of the increase of traffic. Current from dynamos is taken to a main switchboard, and thence distributed by separate armoured cables (simply laid in the ground) to four points in the network of lines; distribution boxes are provided at each point, whence short lengths of cable connect to the line conductors. At times of light load, part of the current from the dynamos passes into a battery of accumulator cells employed to light the offices, engine-room, boiler-house and yards; and when the generating plant is closed down for the night the same battery is also used for sending current (along the line conductors) to feed arc and glow lamps at the two suburban depôts while washing down or repairing the cars. On the lines are employed sixty-three motor cars, eight trail cars, and nine large cars for the Freidhof steam line. The maximum speed is 9½ miles an hour; but a little more than this, about 11 miles, is reached in the suburban districts. On the narrower streets near the centre of the city it is reduced to 6 miles; and at the crossings of important thoroughfares not more than 4 miles an hour is allowed. In consequence of the greater speeds thus attainable on the electric lines, as compared with horse cars, a very much larger daily car mileage can be kept up, with, of course, corresponding profits. Each car averages a run of from 75 to 100 miles per day of sixteen hours.

A complete system of private telephone lines is erected in connection with the tramway network, joining up the extremities with the supply station, which acts in this instance also as a central exchange. Within the city limits the telephone conductors are carried in an inductionless cable alongside and in the same underground trough as the cable supplying current to the line, but outside the city, where overhead wires are not so objectionable, the ordinary poles and light wires are used. Taken as a whole, the Buda-Pesth lines are unique in being the only tramway system or network now in active operation with any appearance of success employing underground line conductors.

COLD-AIR STORES, MANCHESTER.

A MEMORIAL tablet has just been fixed by the Lord Mayor of Manchester for the extensive cold-air stores in the course of erection in Water Street. The plans in accordance with which the work is being carried out were adopted after long deliberation and many visits to towns in which such works are already in operation. It is believed, the *Manchester Guardian* says, that when finished the stores will have no equal in the kingdom for completeness and efficiency. At the present rate of progress they will probably be completed by the end of the year. They are expected to cost about 100,000*l*. The engineer is Mr. Maunsell C. Bannister, and the contractors are Messrs. Robert Neill & Sons.

Mr. Roberts said that before presenting the Lord Mayor with a trowel and mallet for the purpose of fixing the stone, he desired to make a statement with reference to the interesting occasion which had called them together. The stores, he proceeded to explain, had been designed and constructed for the purpose of meeting an important want in connection with the markets adjoining and the other markets in the city, and had also been designed and the site selected as most convenient for the purpose of accommodating the ever-increasing importations of frozen and other perishable goods, and to provide accommodation for such goods coming from our colonies and from North and South America to Manchester *via* the Manchester Ship Canal. The site was eminently suitable for the following reasons. It was within a quarter of an hour of the Pomona docks, both by water and road; it was within easy reach of most of the principal markets of Manchester and Salford, and within a few minutes of the principal railway depôts, from which in the near future direct railway communication might possibly be established. The store was in the midst of an extensive beef, sheep, pig and cattle market, well known to the trade as the Elm Street and Water Street Markets and Abattoirs. From these markets and abattoirs there would be direct tramway communication into the cold-storage buildings, and specially-constructed trams would collect all material required to be stored, and return the same into the markets out of the store as required. The stores consisted of a substantial square block of brick buildings, about 130 feet long by 120 feet wide and 75 feet high from the basement floor, with provision for extension upwards should trade requirements demand it. They contained a basement, a ground

floor and three upper floors. The basement was arranged for the purpose of accommodating goods of a wet or moist nature, and was so constructed that the sanitary arrangements were as nearly perfect as possible. The chambers could be thoroughly washed out when required, and cleansed periodically after each parcel of goods had been stored or removed. It was intended to store in the basement fresh offal from the markets—hides, bacon, fish of every description, and other goods of a similar nature. The basement contained a spacious central corridor, from which entrance would be obtained to the storage chambers at each side. Any of the basement stores, if occasion required, might be used for frozen goods. The ground floor was set apart as being most convenient for dealing with the more heavy material, such as fresh and chilled sides and quarters of beef, which would require to be dealt with during the summer months. Accommodation would be provided for chilling 1,200 sides of beef in twenty-four hours. The meat would be carried to these chill-rooms by means of specially constructed tramways and trucks, so arranged that the sides would be carried in a vertical position and then transferred to the overhead rails and runners communicating with the storage chambers, of which there were six. Weighing machines, lifting gear and other necessities for accommodating the trade in the most efficient manner possible would be provided. These chambers might be used as a market, in which the material could be sold or otherwise disposed of in store, if the trade so required it. On each side of the chill-rooms a large roadway was provided, one on the outside of the building in communication with the overhead rails and runners, and the other right through the premises under cover, where goods would be removed from the chambers as required and weighed on overhead weighing-machines and then placed on carts or trucks as required. On the other side of the covered roadway there would be the steam boilers and refrigerating machinery, as well as extensive electric-lighting engines and dynamos for lighting and at the same time driving and circulating the air through the building. The first, second and third floors would contain the chambers for specially dealing with the higher classes of goods which required freezing temperatures, although any chamber on these floors might be raised to above the freezing temperature when necessary. The stores were practically constructed and arranged so that the greatest despatch might take place both in delivering and receiving goods, and for that purpose a gallery was provided through the stores, each side of which communicated with the chambers.

WORKS, ROTHERHAM. Estab. 1854.

There would be four large chambers on each floor, besides provision in the gallery for storing and drying material before storing. Arrangements of this description would enable all the doors communicating with the gallery to be left open during working hours, so that every facility for ingress and egress to and from the chambers was provided. Each floor would contain a gallery on the north and south of the building, with office accommodation for the staff employed on the premises, as well as for any customers who might have permanent storage accommodation. The first, second and third floors would each accommodate about 20,000 to 25,000 carcasses of sheep or other similar goods. The arrangements for communicating with the various upper floors from the roadway and from the barges to and from the Manchester Ship Canal docks would be as follow:—There will be four hydraulic lifts, two on the north end and two on the south end of the building. From the covered cartway through the premises large receiving stages would be constructed in connection with these lifts, and material would be quickly disposed of from the carts on to specially-constructed trucks. These trucks would be run on to the lifts direct, and sent up or down to any floor as required. It was estimated, from the practical working of similar installations, that at least 4,000 sheep per hour could be delivered on to the stages and removed to any floor of the premises. Besides these four lifts there would also be provided three hydraulic sheep elevators. Each of these elevators was calculated to lift at least 600 sheep per hour, and to discharge the same automatically either from the roadway or from barges directly into the stores on any floor, or to receive goods from the stores and to take them down for removal by cart or otherwise. It would thus be seen that when the four lifts and three elevators were working from 5,000 to 6,000 sheep would be received or delivered per hour. This was considerably in advance of the capabilities of any other store either in London or elsewhere, and the rapidity of manipulating goods stored would be greatly appreciated by the trade. The principal features in connection with this store were that in no chamber or room would there be any machinery whatever, and no snow, fog or damp; that each chamber in the building might be regulated to any degree of refrigeration required, that all superfluous moisture would be rapidly removed from the stores and from the material that was being stored; that the whole of the air contained in each chamber throughout the building would be constantly removed, cleansed, purified and cooled. The entire building will be

lighted by incandescent electric lights, and all conveniences for the trade would be provided in the way of hangers, hooks, trays, trucks and hand luries, with a number of large platform and other weighing-machines on each floor. The machinery, which would be in duplicate, was of the highest class of make and design, and had many new and important features not at present in use in any other store. The plant consisted of two triple expansion vertical marine engines, each driving direct two fifty-ton Linde compressors. Each engine and two compressors would be capable of refrigerating the whole of the chambers in the entire building to any reasonable temperature required, as well as chilling 1,200 sides of beef in twenty-four hours. It was claimed by the makers of the machinery that no part or portion of the apparatus rose at any time more than a few degrees above the normal temperature of the condensing water, and further, that the cold air in circulation would be as pure and dry as that of an Arctic winter. Three Babcock & Wilcox boilers would supply the necessary steam for working the steam-engines. Any two of the boilers could work both refrigerating machines simultaneously, as well as two powerful electric plants driven by special steam-engines, one for the purpose of driving and circulating the air through the chambers, and the other for lighting the premises. The motors driven off the dynamos in the engine-room for driving the circulating fans would be entirely under the control of the engineer in the engine-room. It would thus be seen that there could be no possible apprehension on the part of the trade regarding a breakdown. The temperature of the whole of the stores would be under the control of the engineer in the engine-room, and electric indicators would be fitted in the manager's office to indicate the temperature of each of the various chambers. The cost of these buildings, equipped with all machinery, electric plant, lifts, hangers, &c., as per contract, amounted to from 90,000*l.* to 100,000*l.* This included the extension of the dead meat market, and additional slaughter-houses and lairs.

SANDOWN CASTLE.

THE demolition of a portion of Sandown Castle at North Deal is in progress. The work is being carried out by a party of the Royal Engineers from Shorncliffe, under the direction of Major Kenney. Gun-cotton is the explosive used, and it is fired by electricity. The castle was one of several built by Henry VIII. for the protection of that part of the coast. For many years

VOLUME L. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered.
Price 12*s.* 6*d.*

Office: 175 Strand, London, W.C.

the sea has been encroaching upon the point of land where Sandown Castle stands. For years past the tide has regularly flowed into the interior of the castle. The seaward portions of the structure were considered unsafe to the public by whom the ruins were visited, and the War Office therefore decided to demolish them. In the course of the operations two persons have been struck by missiles and slightly injured.

PRIMITIVE WELSH DWELLINGS.

MUCH interest has at all times been taken in the dwellings of the ancient Welsh. This feeling has been made keener of late by the interesting letters which have appeared from time to time in the columns of the *Western Mail*, and the evidence furnished by Mr. Ivor James to the Cardiff Naturalists' Society in his paper. It was in August of 1892 that Mr. James visited Penygedr Fawr, the highest peak of the Black Mountains, some miles from Abergavenny and Crickhowell, and more than 2,000 feet above the level of the sea. At a spot called Pentwyn Mawr Mr. James came accidentally across a kind of dry ditch. There were some signs of quarrying about. He followed this dry ditch until he found himself standing in front of a large hole which formed an entrance into the very heart of the mountain at the highest point of the ridge. Striking a match Mr. James cautiously descended through a passage some three or four paces in length into a perfectly dark, slightly domed chamber, not quite circular nor yet perfectly square, fitted on one side at least with seats formed of stone slabs.

It was a singular sensation to find himself in the interior of the mountain, and Mr. James's thoughts naturally flew back to the fairies and brownies, to Puck, and the rest of the legendary train, nor did he forget the remark of Malone that Shakespeare perhaps picked up Puck in Cwm-Pwca, near Tretower, among these very mountains, "pooky" in Welsh signifying a goblin. A more prosaic view suggested that the chamber was a mere shelter for shepherds or quarrymen; but of one thing he was certain, that it was in no sense of the word a natural cave, and that the roof was quite on a level with the ground, and visible only on close inspection. It was not possible at the time to make any accurate measurements of the chamber.

In the neighbouring hills Mr. James subsequently discovered a number of shallow circular depressions, which he ascertained were to be found in great numbers elsewhere on the high land round Llanthony, and so on. On Bryn Arw,

near Llanvihangel, these depressions are to be numbered by hundreds, and Dr. Bull, of Hereford, had given them the name of hut circles. Some of the Bryn Arw circles were 5 or 6 feet in depth. It was very strange that these circles were marked on no map, and had received little or no attention from travellers or tourists. The bulk of the people whom Mr. James questioned had never seen or heard of the circles, but one man said they were ponds to serve the mountain sheep with water, another that they were shelters for sheep in winter, and a third that they were pits for burning charcoal. The pits were usually found in clusters, and Mr. James argued that both the pond and shelter theories were untenable, nor was there any trace of charcoal-burning about them.

At a later period Mr. James returned to the neighbourhood of the circles, accompanied by several naturalists. On the way up the hill, near the summit, Mr. T. H. Thomas called attention to some dry walling. On the heights above, the circles were found in great numbers, and were examined and discussed with great interest and care. Mr. Robinson thought the depressions were due to the action of water, but this was stated to be improbable by geologists whom Mr. James had consulted. Mr. T. H. Thomas thought the depression might have been made by quarrymen in search for stones, which idea was somewhat supported by local tradition, but the great number of the circles was a great objection to this, for it was scarcely conceivable that any seekers would uncover a great proportion of the mountain top in search for building and roofing stones, which might be obtained with much less trouble nearer their homes and work. There was a general opinion among the party that the circles of Bryn Arw were the work of man, and that they were very much like the hut circles found in other parts of the kingdom. Incidentally it might be mentioned that the name Bryn Arw (rough hill) was probably given the hill in remote, possibly prehistoric times; but there is nothing rough about Bryn Arw save these very depressions. Unfortunately the party were unable to visit the chamber first mentioned, nor had Mr. James been able, as he hoped, to secure photographs of its interior. There was (remarked Mr. James) no necessary connection between the chamber and the depressions, and with the origin of the latter the lecturer proceeded more particularly to deal.

Assuming that the theory of their being hut circles was correct, and that they were the foundations of human dwellings, the question arises, What induced the inhabitants of these parts to prefer the barren hills to the rich plains and valleys of

ROLLED IRON AND STEEL GIRDERS.

BEN WALMSLEY,
IRON & STEEL MERCHANT,

Hereford and Monmouth? Could anything like them be found elsewhere? Answering this question at some length, Mr. James drew attention to the gipsy encampment of our day, with its invariable circle; to the hut circles at Weston, where bones, flints and the like were discovered; to the dwellings of the Aleutians, Shushwap Indians, Greenlanders, &c. Might not these be the modern type of the ancient huts of Bryn Arw, the ancient dwellings of the Britons, and might not also certain old pigstyes at Machen and Llantrithyd be survivals pointing in the same direction? But granted that the circles were the remains of ancient huts, who built them, and when and why were they erected on these mountains? The reply to these questions involved an interesting historic disquisition, in the course of which Mr. James referred to the brave and determined stand made by the Silures against the onward march of the Romans, whose efforts were taxed to the utmost to retain possession of the country. The settlements of the Romans were in the plains and valleys; the natives were driven to their mountain fastnesses. After the Romans came the Saxons and the Normans, and Mr. James Davies and Mr. Bevan had prepared a map showing the respective remains, which, for the district it covered, gave the following figures:—British 13, Roman 3, Saxon 3, Norman 23. At Brampton Ryan we have a Norman castle, an Anglo-Saxon castle, a Roman camp and a British camp lying close together, a fact very suggestive of the endless conflicts which occurred in the locality.

It has been said by a competent Welsh writer that during 400 years, between the departure of the Romans and the Norman Conquest, there was scarcely a square foot of the country which had not been stained with human blood. Now all these Roman, Saxon and Norman fortifications were erected at the base of the Welsh mountains, a fact significant of the real state of the case. There was independent proof that the Welsh had been driven, as a last extremity, to the mountains, yet there was not on those mountain spurs a house, a cottage, or even a wall. Where, then, did the "wild Welsh" live? Did not these facts in themselves form presumptive proof that the circles were the sites of British villages, first formed, it might be, in neolithic times, and repaired as occasion required from age to age and century to century? They may yet be proved to have been the cities of refuge to which the Welsh fled during successive invasions. In conclusion, Mr. James suggested that the work of excavation, by way of throwing further light on the origin of the hut circles, might profitably be undertaken by the Cardiff Naturalists' Society.

REGISTRATION OF PLUMBERS.

THE annual public meeting in connection with the Bradford District Council for the National Registration of Plumbers took place at the Bradford Technical College on Thursday, March 1. The chair was occupied by Mr. Charles France, architect, and the following gentlemen took part in the proceedings:—Dr. Rabagliati, Dr. Harry Meade, Dr. Evans (medical officer), Mr. W. T. McGowen (town clerk), Mr. Jas. Watson (waterworks engineer), Mr. J. H. Cox (borough surveyor), Dr. Ainley (medical officer of Halifax), Mr. Keighley Watson (town clerk of Halifax), Councillor Wade (Halifax) and others. A deputation from the Worshipful Company of Plumbers, London, also attended the meeting.

The United Trades' Council, at its meeting at Dublin, passed the following resolution:—"That we consider the recommendation of the public health committee as to the appointment of two plumbers as sanitary inspectors should be supported by all the members of the Corporation, seeing that it will not be any extra cost on the ratepayers, and also that the citizens will get the benefit of skilled men instead of the incompetent parties at present employed."

At the meeting of the Court of the Plumbers' Company at the Guildhall the following ten operative plumbers were admitted to the honorary freedom of the Company, having passed the City and Guilds of London Institutes' examination in the theory and practice of sanitary plumbing first class in the honours grade:—Arthur Britton, of Leeds; Harry Callow, of Brixton; William Carl, of Bristol; Peter John Chaplin, of Battersea; John Frederick Cutty, of Bristol; Chas. Woodville Dyke, of Liverpool; David Early, of Sydenham; Thomas Briggs Hunter, of Windsor; James Joseph Lyon, of Liverpool; Henry Wallace McClellan, of Lambeth.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

HALLIDAY'S CLAPTON LIGHTS.

Simple, Powerful, Economical. Reflection and no Complication.

OPEN TOP, AS SHOWN, OR VENTILATING. PLAIN OR ORNAMENTAL.

Much used in Places of Worship, Lecture Halls, Board Schools, Shops, Large Offices, Markets, &c.

Suitable for wherever a Very Powerful, Well Diffused, Soft, Economical, and

Easily Managed Gas Light is desirable. Made in Five Sizes.

HONoured WITH SUNDRY IMITATIONS.

Seven years from Invention up to April 1890 over 11,300 sent out. But
Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong."

R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

TRADE NOTES.

WE have recently had an opportunity of inspecting the extensive works at Berry Hill, Stoke-on-Trent, of Messrs. Henry Warrington & Son, manufacturers of glazed bricks, white and coloured ironstone enamel, glazed sinks, fireclay, firebricks, chimney-pots, &c., all of which are specialties of this firm, as well as ornamental bricks in all colours. As to the works themselves, they are among the most interesting of any we have visited, and the whole of the arrangements please the eye and leave an impression on the mind that beauty can be introduced into our large hives of industry. Anything we could say in commendation of the productions of the firm is warranted by the articles, which carry in themselves their own credentials. Messrs. Henry Warrington & Son are, moreover, fortunate in possessing a bed of splendid clay. Space will not now allow of any detailed description of the works, nor of the productions of the firm, but we should like to call the attention of our readers to a peculiar advantage possessed by this firm's system of enamelled brickwork, for ordinary and decorative purposes. As to colours and tints, they can be had in every variety and shade, but one great merit, as it appeared to us, was that part of the system by which a most perfect key is afforded. This has been patented, and the principle, as is the case of nearly all the best inventions, is exceedingly simple. The bricks are manufactured with an overlapping surface which is keyed on all sides, so that when fixed it is absolutely impossible for any moisture to penetrate through the joints formed by the cement. A perfect key or lock it will be found is produced by the overlap of the bricks, and the overlapping surface fits so closely that only the faintest stroke of cement is necessary just to show the joint—the unsightly mortar-joint being completely hidden by the overlapping enamelled surface. This is a great advantage as compared with the large mortar-joint, which cannot be avoided in ordinary brickwork. It cannot be doubted that many will appreciate this most useful invention, one which will save expense both as to time and cost, and produce perfection and solidity in construction and durability, besides making the walls absolutely weatherproof.

AMONG the works executed during last month and others about to be completed by Messrs. Burt & Potts, wrought-iron and gun-metal casement makers and engineers, York Street, Westminster, are the following:—Sandringham Hall, for H.R.H. the Prince of Wales; the Tower Bridge, for the City

A. Waterhouse & Sons; new premises, Rye Lane, Peckham, for Messrs. Jones & Higgins; *Lloyd's Newspaper* Offices, Salisbury Square, Fleet Street, E.C.

WE hear that the Queen has had lifts erected at Balmoral, Osborne House, Windsor Castle and Buckingham Palace for her own exclusive use. Messrs. R. Waygood & Co. carried out the work, and have been appointed lift-makers to Her Majesty. Amongst other orders in hand are the following:—Queen Hotel, Harrogate; Palace Hotel, Kensington; Palace Hotel, Hastings; Hotel Métropole, Cromer; Crystal Palace, Sydenham; Messrs. Erard & Son, Great Marlborough Street; South-Eastern Railway passenger lift at London Bridge Station; Midland Home for Incurables, Leamington; an hydraulic patient's lift; passenger and other lifts for Messrs. Lazarus & Rosenfeld; Mr. Phelps, Milk Street; Messrs. Jones & Higgins, Peckham, passenger lift; also one for Messrs. G. Wright & Co., 153 Queen Victoria Street, and one patent triple-power balance passenger lift for the Liverpool Exchange, &c.

At the meeting of the Birmingham School Board the tender of Mr. B. Whitehouse, Monument Road, amounting to 12,509*l.*, for the erection of a school in City Road, Rotton Park, was accepted.

THE Worcester City Council have appointed Mr. Caink city surveyor and engineer, at a salary of 450*l.*, in the room of the late Mr. Purchas.

ELECTRICAL.

WORK is to be commenced at Coventry for the electric tramways. It is expected the cars will begin running in the summer. The system is that of overhead electric wires, and the trams will run to Bedworth, a distance of over five miles, with a regular ten minutes' service to and from Longford, the most populous three-fifths of the whole route.

At a meeting of the Edinburgh Corporation electric-lighting committee it was agreed that the charge for electricity should be 6*d.* per unit for lighting and 3½*d.* per unit for motors.

At the meeting of the Liverpool City Council a letter was read from Mr. Rouse, secretary Liverpool and Vicinity United Trades and Labour Council, enclosing copy of the following resolution passed at their last meeting:—"That this meeting of the Liverpool and District Trades and Labour Council urge upon the City Council, in view of the present exorbitant price of gas, to consider the possibility of utilising the tidal force for the generation of electricity, thus improving the lighting of the city at a reduced cost to the ratepayers, the construction of the works also affording employment for some of the surplus labour in the market."

At the meeting of the Cheltenham Town Council the electric-lighting committee recommended that the tender of the Galloway Company for two of their boilers at 438*l.* 15*s.* each be accepted. They also recommended that the quick-running type of engine be adopted, but before finally deciding on the particular engines and alternators the committee thought it desirable to see and inspect the system in operation at Bristol, and that, subject to such inspection being satisfactory, the tender of Messrs. Siemens & Co., of Westminster, with Willan's engines, at 4,610*l.*, less 365*l.* for boiler, be accepted.

VARIETIES.

THE Duke of Hamilton has presented twenty acres of land to the town of Hamilton for the purposes of a public park.

THE Aberdeen authorities propose clearing out the slum region of Exchequer Row and forming it into an open space or playground for children, at a cost of from 8,000*l.* to 9,000*l.*

In these conduits there are about 32,600 miles of telephone and telegraph wires and 1,300 miles of wire for lighting purposes, with which about 6,790 arc lights and 268,000 incandescent lamps are connected.

At the meeting of the Manchester Association of Students of the Institution of Civil Engineers, Mr. H. Stowell read a paper on "Refuse Destructors." He first dealt with the necessity for refuse destructors and the refuse to be destroyed, and then described various forms of furnace—Fryer's, Whiley's, Warner's and Horsfall's furnaces—also a modification of the last, now being erected at Agecroft for the Salford Corporation. He also described Jones's fume cremator and other appliances, and remarked upon the cost of destructors, the amount of refuse burnt and cost of burning. He also treated of the amount and disposal of clinker, the utilisation of the heat generated and of points to be observed in avoiding a nuisance.

THE Town Clerk of Crieff has received a communication from Dr. Meikle, of the Hydropathic Establishment, withdrawing his gift of a building, to cost over 3,000*l.*, for an infectious diseases hospital for the town, owing to the amount of opposition the matter had met with from the public.

THE sons of the late Mr. Robert Heath, of Biddulph Grange, at one time member for Stoke, have intimated their intention to give 20,000*l.* to the North Staffordshire Infirmary, for the purpose of building a convalescent hospital in memory of their father. Mr. Heath was head of the largest firm of ironmasters in North Staffordshire.

At the meeting of the Oswestry Town Council, a letter was read from the Local Government Board sanctioning a loan of 1,890*l.* for the construction of the waterworks, instead of the 2,250*l.* asked for.

At the meeting of the Hereford Town Council, the gasworks committee recommended that 7,000*l.* should be borrowed to carry out the works of improvement at the gasworks. The waterworks and lighting committee also recommended that 3,500*l.* be borrowed for the purpose of putting in new machinery at the pumping-house in connection with the waterworks. The reports were adopted.

THE proposal made some years ago to connect the east and west coasts of Scotland by means of a Forth and Clyde Canal sufficient to carry the largest ocean steamers, has been revived. The project was well received, and a preliminary survey was made, but as the Government would not give it support, the

cost was too much for private enterprise and the scheme dropped.

THE engineer to the Great Northern Railway Company has prepared the estimates of the cost of constructing the proposed new railways at Finsbury Park, to facilitate the suburban traffic of that company at Islington and Hornsey. The total estimated cost of the whole of the five new projected railways is set down at 386,662*l.*, of which it is estimated that 190,000*l.* will be expended in acquiring the necessary land with the buildings thereon. The sum estimated to be required for stations is 60,000*l.*

WE notice that Mr. Sell, of 167 Fleet Street, has brought out the "Directory of Registered Telegraphic Addresses," a work which has been long desired, but owing to official opposition could not be prepared. Mr. Sell has been successful in overcoming all obstacles, and has enriched business literature with a most useful volume. It is hardly necessary to say that the information supplied will enable time as well as money to be saved in correspondence.

WE have received from Messrs. Thomas Cook & Son, of Ludgate Circus, a copy of the programme of their proposed personally-conducted tour to Buluwayo. The excursion will leave London on April 14, returning to London on September 11. The territories to be visited include Cape Colony, Orange Free State, Transvaal, Matabeleland, Mashonaland, hunting-grounds of the Pungwe district, Manicaland, Natal, &c., with visits to the gold fields, diamond mines, ruins of Zimbabwe, and other prehistoric remains. The programme now before us is a little brochure with many illustrations, and accompanied by a useful little map. The views shown in the illustrations are taken from photographs, and add interest to the details given in the letterpress. Information is also given in regard to sport to be had *en route*.

THE bridges committee of the London County Council recommend an application to Parliament for power to rebuild Vauxhall Bridge, at an estimated cost of 454,000*l.*, including 30,000*l.* for a temporary timber structure, 50 feet wide, and that Lea Bridge be rebuilt at an estimated cost of 10,000*l.*

THE London School Board intend that all building contracts entered into in future shall contain a schedule of the rates of wages as generally recognised and paid at the time of the signing of the contract, in order to give greater security to the workmen.

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON)—"You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

BUILDING AND BUILDERS.

THE long-established "Laxton" has again made its appearance under the auspices of Kelly & Co., Limited. Experience has directed the proprietors and compilers to the safest sources of information concerning the cost of builders' work of all varieties. The appendices on legal and other subjects increase the value of the book, and can be safely employed as references in legal matters.

PLANS have been prepared for the erection of the new church of St. Aidan, for the conventional district of School Lane and Withy Trees, in the parishes of St. Leonard's, Walton-le-Dale, Preston, and St. Saviour's, Bamber Bridge. It is proposed to spend about 5,000*l.* on the first part of the structure.

THE *Glasgow Herald* says:—Messrs. Moss, Thornton & Kirk are at present negotiating for the purchase of the entire block of Gaiety Buildings in Sauchiehall Street, including shops, tenements and theatre. When the purchase is completed they purpose making extensive structural alterations and erecting an elaborately-appointed theatre, to be conducted on the same lines as the Empire, Edinburgh, which is acknowledged to be a most successful and high-class variety theatre. Messrs. Moss, Thornton & Kirk have variety theatres in Bristol, Birmingham, West Hartlepool, South Shields, Newcastle, Edinburgh, and the Gaiety and Scotia, Glasgow.

THE general committee of the Staffordshire General Infirmary have decided to recommend to the governors and subscribers a scheme of reconstruction, which is estimated to entail an expenditure of 12,000*l.* or 13,000*l.* Recently a new wing has been added to the Infirmary, but it is now found that total reconstruction of the main building, which dates from 1766, is most desirable, and this the committee propose to effect at the cost stated.

THE stoppage in the building trade of Newcastle and Gateshead, which for three weeks has laid idle two thousand men and prevented building work in the district being carried on, has terminated at a joint conference of the masters and the men. It is proposed to take steps for the formation of a conciliation board, which shall deal with all differences in future.

At the municipal meeting, Pollokshaws, the building committee recommended that the plans of the tenement which Mr. George Beveridge proposed to erect at the corner of Bengal Street and Main Street be passed. Considerable discussion took place, Bailie M'Naught strongly opposing the plans, on the ground that they did not comply with the building regulations. The Provost said if the Commissioners were too strict building enterprise in the burgh would be killed. They could not on all occasions adhere to the letter of the law. The plans were ultimately approved.

NEW CATALOGUE.

WE have received a catalogue entitled "Metal-jointed Bamboo Furniture," Mr. W. F. Needham's patent. Mr. Needham in submitting this second catalogue, with revised price list, calls attention to the fact that it comprises a largely increased number of designs—a result mainly arising from the success attending the first catalogue, and the generally recognised importance of the patent metal joint and brass shoe, and the patent method of securing table flaps. The latter essentials, which impart to bamboo furniture that solidity, durability and finish absolutely requisite to articles intended for daily or even occasional use, are of much advantage, as furniture to which they are not applied lacks strength, and is liable to damage even in being dealt with in the handling inseparable from business, and before reaching the customer. Illustrations have been introduced into this catalogue demonstrating the adaptability of bamboo to the complete furnishing and artistic decorating of rooms, halls, staircases, &c. The pieces of furniture shown are principally stock numbers to approximate the cost of furnishing a room or rooms, decorating being necessarily a matter of estimate. A feature of this issue is the new bamboo window blind. The advantages claimed for it are (1) no discolouring in course of time, (2) artistic yet inexpensive, (3) can be renovated by the simple

application of ordinary naphtha varnish. New designs are being continually brought out, as may be seen by an inspection of the showrooms in Branston Street, Birmingham. Estimates or designs are prepared upon necessary particulars being supplied. Before leaving the manufactory the tables are accurately fitted, and care should be taken when unpacking them that the parts of each are kept together, so that when refitted each occupies its original and specially-fitted place. The bamboo bars are marked with numbers corresponding to those on the sockets to which they have been specially fitted. These numbers are underneath the bars, and in putting the tables together the numbers on the bars and sockets must be in line. The illustrations in the catalogue show very clearly the artistic effects that can be obtained at a very small cost by use of this material.

THE "ACME" VENTILATOR AND CHIMNEY-TOP.

MR. GEORGE COOPER, of the Electric Works, Sheffield, is the patentee of this excellent contrivance for the prevention of down-draught of smoke into a room. The "Acme" consists of a number of shields, which are rivetted to a common axis and so arranged that they cover up in a radial manner the whole of the opening at the top of the air-shaft, space being left between the edges of each shield. By this means, whether the wind descends, ascends, travels obliquely or laterally, it creates a continuous and powerful up-current. This combination of a ventilator and chimney-top seems a perfect arrangement, based on the simplest principles. Mechanical parts are avoided, and therefore less attention is required, and no after cost for repairs. Ventilation is provided for in the openings between the shields, and the area of these being twice as large as the area of the air shaft a free discharge of vitiated air is provided. Perhaps the most important feature in the "Acme" ventilator and chimney-top is that the slightest wind, no matter from what quarter, will create an up-current. Mr. George Cooper is no tyro in the science of ventilation, for as long ago as 1851 he invented the "Venetian" chimney-top, which was exhibited at the Polytechnic Institution, Regent Street. He has been endeavouring ever since to discover a means of effectually preventing down-draught in chimneys, and now claims to have accomplished this, and he trusts that its merits may be generally appreciated. There is certainly a demand for such a trustworthy appliance. We notice that the "Acme" has been used at the

new Theatre Royal, Sheffield; Wesley College, Sheffield; by the Dukes of Norfolk, Portland, Devonshire, and also by prominent architects all over the country. We may add that the

"Acme" ventilator and chimney-top is made of plain and ornamental patterns to suit all requirements, and that the price and quality will compare favourably with any in the market.

SUBMERSION OF THE PHILÆ TEMPLES.

IN a letter to the *Times*, Lieut.-Colonel Justin C. Ross, late Inspector-General of Irrigation in Egypt, writes:—I notice in your paper of February 28 that "Civil Engineer," writing from Chester, puts forward as a reason why the Philæ temples should be drowned that the water would beautify the site by cleaning away the mud huts of the Christian period, and that if the temples did not suffer from immersion any more than the stones of its river face wall have suffered there would be no harm done. He, in the first place, forgets that the coloured pillars would lose their colour. But, worse than this, his letter shows such an imperfect knowledge of the working of the Nile reservoir that his whole argument is vitiated. He

JAMES HILL & CO., 100^A Queen Victoria Street, London, E.C.

thinks that the island would be submerged from May to September—months in which few non-official Europeans travel. He also says that during the tourist period the island would appear clothed with verdure and far more beautiful than it does to-day, as he supposes that the arid waste of crumbling mud hovels which now exist would be replaced by a beautiful garden.

I will now show how the facts stand in connection with the working of the reservoir.

The reservoir is not, as he imagines, a lake in the Nile Valley, to be filled with the surplus flood-water of the Nile from July 15 to September 30, but it is a lake held up by a series of sluices in a dam, which will pass the entire flood supply of the Nile through the bottom of the wall of the dam, and it is only after October 20 or thereabouts that any impounding of water will be effected. We Indian engineers are to a man against any impounding of the Nile flood or "red" water, as the reservoir would silt up in a somewhat short time, and because the impounding of the "red" water would deprive Egypt of a large quantity of its precious mud deposit. It would also be impossible to impound flood water in bad years in the height of the irrigating season. The Delta also requires a last flooding after the cotton and maize crops are matured to enable the fellah to sow clover and barley after these crops and to give a final flush watering to the wheat lands before sowing. If the reservoir is filled in the beginning of October a very large amount of this watering would have to be done by steam pumps at a heavy cost, as the Nile would be lowered below the level necessary to give flush irrigation.

The time for filling the reservoir may be generally assumed to be from November 1 to January 1, and the reservoir would probably rise over the temples of Philæ by December 1, so that when the tourists arrive in January the lake would be full, and it would be maintained full until May 1 at the earliest, and it would be gradually emptied in the summer months of May, June and half July. After July 15 the flood is rising, and the quantity of flood water passing Aswân is more than that in the river during June, with the future supply of ponded water added to the natural supply.

As to the cleansing influence of the Nile water as evidenced on the water wall of the temples, "Civil Engineer" forgets that in November and December the water, though not thick with mud, is so brown that one's hand cannot be seen at a foot below the surface. The mud at this season is a very fine slime deposit, which would gather on the temples, and in

June, when they emerged from their bath, they would be covered with a coating of mud about a quarter of an inch thick, which would flake off irregularly and the temples would have a very mangy appearance. Algæ would also grow in long festoons on the beautiful pillars, and would hang in withered strips on the retiring of the water.

I hope I have succeeded in showing that your correspondent, from a want of knowledge of the details of the scheme, may have inadvertently led some of your readers astray and given them a beautiful picture of the washed temples of Philæ smiling out of a beautiful public park with rose-gardens in their courts.

I would also call public attention to the fact that many of the members of the Egypt Exploration Fund had full evidence that the temples were to be flooded, and therefore your correspondent is wrong in saying, "The resolution assumes, without evidence, that if the temples are submerged for some months each year, they will be destroyed."

THE LIABILITIES OF JOINT CONTRACTORS IN SCOTLAND.

A RATHER novel action respecting the responsibility for accidents in buildings where there is no general contractor, in the English sense, has been heard before Lord Kyllachy in Edinburgh. The plaintiff, Mr. John Gardiner, sued Messrs. J. & A. Main—all the parties belonging to Falkirk—for 373*l.* 13*s.* 8*d.*, or alternatively for 186*l.* 16*s.* 10*d.* for payment of damages found due by the plaintiff to three of his own workmen in connection with an accident which occurred through the fall of a scaffold erected by the defendants for the use of the plaintiff's men. The plaintiff was the contractor for the mason-work of the Wesleyan Methodist Church, Falkirk, and the defendants were contractors for the carpenter-work. The peculiarity of the case was that there was no contract between the plaintiff and the defendants. The scaffolding was erected by the defendants under their contract with the church committee, and plaintiff's contract with the church committee made no reference to the subject. The defendants, however, undertook to the church committee to erect the necessary scaffolding where required by the mason, and the plaintiff averred that this was in accordance with the usual custom in building undertakings, and that according to such custom the church committee contracted with the defendants on behalf of the

plaintiff, and they were consequently bound to the plaintiff to erect a scaffolding as required.

Lord Kyllachy said that what he had to decide was, in the first place, whether upon these averments he could sustain the action as one *ex contractu*, or could allow proof of the alleged custom in order to set up the alleged contract on the plaintiff's behalf. The contracts produced did not, in his lordship's opinion, support the plaintiff's contention that the common employers, the church committee, made a contract as regards scaffolding with the defendants on behalf of the plaintiff. They were just ordinary building contracts made between the tradesmen and their employer, and contained nothing which could set up a contract as between the tradesmen themselves. If this was the just construction of the contract deeds, was there any room for the proposed proof of custom? He could see none. The plaintiff, however, argued that he might maintain his action as one of relief upon grounds apart from contract, his suggestion being that he and the defendants were jointly liable, *ex delicto*, and that, although the workmen chose to go against the plaintiff alone, the liability ought to be equal, as it would be in the case of a joint and several debt. But his lordship saw no principle upon which the defendants could be made liable as was proposed, and accordingly dismissed the action with costs.

BOROUGH ENGINEERING IN AMERICA.*

If an engineer wishes to accumulate a large amount of peculiar experience, I know of no better plan to pursue than to have himself appointed city civil engineer in an old Indiana village, which, on account of some unexpected accident, finds itself suddenly started on the upgrade of prosperity and just budding into cityhood. The law authorising his appointment is peculiar, the city Council which makes the appointment is peculiar, but the most peculiar thing connected with the whole matter is, perhaps, the very peculiar idea that people generally have of the duties of the city civil engineer. The city where the writer began his career of city engineering was an old-timer, having been platted away back in the "twenties," and when I say platted I tell it all, for that was all that was done. No monuments were put in, no stakes were driven, and from the best evidence obtainable

* A paper read before the fourteenth annual convention of the Indiana Engineering Society, by C. G. H. Goss, city engineer.

the land itself was not even measured. As lots were sold they were measured with a grape vine, stepped off, or guessed at. In early times potato patches and onion beds were more to be desired than streets and alleys, so all doubts as to measurement went in favour of the lots. When one man built a fence on his supposed lot line, his neighbour farther up the street sighted out his lot line by this fence; thus the first fence on a street determined in a large measure the direction of the lines of that street. These and other arbitrary procedures were carried on while the town was passing through that uncertain stage when no one knew whether it would live or die.

One day the people of the county, in a fit of more than usual absent-mindedness, elected a resident of the village to represent them in the Legislature. This man was a long-headed patriot, and his sole qualification for a lawmaker was his undisputed ability to do the wrong thing at exactly the wrong time. This statesman thought he saw a danger signal ahead, and upon investigation he decided that the danger was that numerous Indiana villages might become large cities eventually. He concluded that this danger might be averted, and that the best method of prevention was to vacate as many as possible of the streets and alleys of these villages. He set to work and prepared a bill which made this vacation easy and expeditious. The Legislature, after carefully scrutinising this bill and finding therein no mention of civil engineers, concluded that it must be about right, and passed it. Immediately after its enactment the farmers purchased all the lots they could pay for, fenced them in with their lands, and the larger part of the town became cornfields and cow pastures. The town struggled along, however, and grew slowly in spite of the inhabitants until more room was needed. When these horny-handed grangers found they could turn several good dollars by selling lots, they wished they were back in town, but they did not know exactly how to get there.

About this time that mystery of mysteries, the county surveyor, came upon the scene. If he had ever been there before he had carefully and thoroughly obliterated his tracks. He was asked to lay off lots after the original plat of the town, and feeling at all times equal to any emergency he proceeded to his task. He traced his lines and turned off his angles by the needle, and measured his distances with a 4-inch rod chain that was anywhere from 10 to 18 inches too long. However, land was comparatively cheap, and if a lot was 68 by 136 feet instead of 66 by 132 feet, it was thought to be all right. If a man wished to build and did not have room

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3½ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

14 Palmer Street, Westminster, London.

enough on his lot he went into the street and took what he needed.

Time rolled on, and after the town had grown still larger it was incorporated and run under a town government and the marshal made street commissioner. This street commissioner and his successors succeeded in putting in operation a system of street building and drainage that was at the time the wonder and admiration of the entire community. When a street was finished under their plans it was about like this. The canal occupied one-half the street, and the excavated material from the canal was used to raise the remaining part of the street some 2 to 4 feet above the abutting lot level, so that the roadway was sure to be above high-water mark. In wet weather the street looked like an ordinary canal with the common towpath attachment. Their system of drainage also provided for "evaporators." These evaporators were natural depressions or basins, of which there were quite a number in the town. They made a canal along a street until it reached one of these basins and then turned loose the water, where it remained until infiltration and evaporation removed it.

The town government continued until 1884 when, after due ceremony, it gave place to a city government. The writer was present at the first meeting of the city Council and noted the expression of blank amazement upon the countenances of the members when their attorney informed them that under the law they must appoint a city civil engineer. Upon consultation they thought it best to inquire for what purpose a city engineer was needed. The attorney confessed that he did not know of any possible use they would ever have for an engineer, but the law directed that they appoint one and perhaps they should follow the law in this instance, especially as it would not cost anything. One councilman said that he had been elected to this important office by the intelligent people of his ward to represent and protect their interests, and if he was assured that the appointment of a city engineer would not conflict with the rights of his constituents to allow their cows, hogs and horses to run at large upon the streets of the city, he was willing to make the appointment. The attorney was pretty sure that a city engineer would have no power to restrain the liberty of the live-stock of the city. He thought the appointment was merely a matter of form, and he was confident that the city engineer would be allowed to exercise no authority at all and but a very limited amount of judgment and common sense in the management of city affairs. This explanation seemed to satisfy the Council and they immediately began to look about

for some one to appoint. At length a member who had some sort of grudge against me, proposed my name and they proceeded to ballot. My popularity and the fact that there was no other candidate, enabled me to poll the entire vote of the Council, and the mayor declared me duly appointed city engineer. I held the office about six months, during which time I did no work and consequently drew no pay, for the Council had fixed the engineer's wages at 2 dols. a day when he worked, and allowed him to do city work only when ordered. I decided to change my residence, and handed in my resignation full of expressions of regret and thankfulness for the high honours conferred.

The Council then appointed to the vacant office the county surveyor, George W. Pearce, a now deceased member of this society. The first thing he did after his appointment was to convince the Council by an object lesson that an engineer's work was worth somewhat more money than it had expected to pay. About the first systematic improvement undertaken was the building of eight squares of brick sidewalks on as many different streets. All work previous to this time had been paid for with funds from the general treasury, and when it was decided to compel the property-owners to pay for building the walks abutting on their property a mighty howl went up. The engineer was ordered to stake out the work and advertise for bids. He asked to be allowed to establish grades for all streets upon which work was contemplated. This was refused, the Council saying that the city had moved along remarkably well so far without grades, and it was likely they could get on without them for quite a while. They knew of no reason why an engineer should want a grade for a whole street from which to set one square of sidewalks. The engineer argued, begged, coaxed, demanded without avail, and finally, in sheer desperation, guessed out a grade for his walks. Soon after the completion of these sidewalks Mr. Pearce died, and the office remained vacant quite a while, as there was no engineer then in the city, and outside engineers demanded as much as 5 dols. to 8 dols. a day for their services, while labourers were receiving but 1.25 dol. a day.

Then the writer became a resident of the city again and was appointed city engineer. About this time the people residing in the vicinity of the "evaporators" became disgusted with being overflowed every time it rained enough to start the water in the canals, and they began hauling and dumping mud and sand on the streets until the people sitting in their front yards had to look up at an angle of about 30 deg. to see a

P. A. GILBERT WOOD, 175 STRAND, LONDON, W.C.

carriage on the street. The street commissioner, who was an ex-road supervisor, contended that he was fully able to handle the street business without any help from the engineer. One day they set him to improving a street, and luckily his field of operations lay in the most difficult part of the city to drain. This street commissioner was a hustler; when he worked he worked, and very soon the residents along that street were anathematising the Council, the street commissioner, and the labourers on the work. The commissioner paid no attention, however, to this racket, and before the authorities could stop him had constructed in the street a fairly good reservoir, with ample capacity for a small waterworks plant. The outlandish system of street work practised necessitated putting in numerous culverts and footbridges, all built of plank with wooden foundations. The life of these structures was from four to five years, and as there were about 800 of them their maintenance was a source of considerable expense. One day a bridge over one of the canals went down with a team and badly crippled both horses. The owner of the team brought suit against the city, and had no trouble to procure judgment for the whole amount of the damage. The Council then undertook to investigate the bridge business, and in their extremity asked the opinion of the city engineer. He advised them to dispense with the entire lot of old traps. This advice alarmed them. Their fathers used these bridges; if they were removed the beauty and usefulness of the streets would be impaired. The engineer told them that if they would cut down the streets, put in curbing, and make common-sense gutters, the bridges would not be needed. After a time the Council decided to take out a few bridges as an experiment, and ordered the street commissioner to remove about a dozen of the oldest ones. The commissioner refused to do this, the old settlers having scared him. This action of the commissioner nettled the Council, and they dispensed with his services, appointing in his place a man who, they thought, knew just enough to obey orders. This new commissioner took out the bridges as ordered, and the job suited him so well that he kept up the good work without orders, and during the first month of his campaign took out about 400 of them. It took considerable time for the idea to work into the heads of the old settlers, but it finally got there, and they acknowledged that the taking out of the bridges was a great success. This admission was regarded by the engineer somewhat in the nature of a victory, and he duly thanked the hard-headed street commissioner who made its achievement possible. Shortly after this the Council ordered the engineer

to prepare and present plans, specifications and estimates for the improvement of the worst street in the city, down which a lively spring branch wound its way to a State ditch. This was the engineer's opportunity to impress the Council, and he took advantage of it. His plans provided for a modern brick-paved roadway, with first-class curbing and cement sidewalks. He proposed to carry the branch and storm water under the street in a sewer so constructed that it could become part of any sewerage system that might be adopted in the future.

At the next meeting of the Council the engineer was there with his plans, specifications and estimates. He decided to hold the estimates to the very last moment, not knowing the exact effect they would have on the members. At the proper time he spread the profile on the table and asked the councilmen to inspect it. Before beginning the survey for this street the engineer put in a good stone bench-mark and established a datum 100 feet below the top of this stone. In the explanation of the plans he thoughtlessly mentioned something about this datum. The remark precipitated more debate, and required more explanation. Finally the members agreed that they could not understand it at all, and could see no use for such a thing in connection with the matter in hand. The engineer then explained the plans for the street, urging, in the best language at his command, the desirableness of the improvement and the final economy of making it according to his plans. His explanation seemed to be very satisfactory to the Council, and just at the time when he thought things were coming his way with a rush, some one asked for the estimate of the cost of the work. It was given. When the Council recovered somewhat from their bewilderment and settled right down to business, they killed the project as dead as the historical door-nail in about one minute, and the engineer was obliged to gather up his papers and depart.

Finally, the people generally began to realise the fact that it was all well enough to have one or two watch-dogs of the treasury on duty, but that a city Council composed entirely of watch-dogs was undesirable. After this a great change was noticeable in the drift cast up by the waves after the annual political storms. The change was not abrupt, but it was sure. The engineer was consulted; his ideas and judgment were considered of value; he was employed and paid for his works. Public opinion regarding city improvements has changed materially for the better. Now, instead of fighting every enterprise the people are demanding improvements which the city is unable to give.

CIVIL AND MECHANICAL ENGINEERS' SOCIETY.

A PAPER was read before the last meeting of this Society by Mr. J. F. Reade, A.M.I.C.E., on "The Applications of Water Power." The author commenced by dealing with the principal matters requiring attention in the preliminary investigation as to the power to be obtained from any stream that it was proposed to make use of for obtaining power. He then proceeded to describe various machines employed in utilising the power to be obtained from water, among them being the undershot water-wheel, the breast water-wheel, the overshot water-wheel, the pitchback water-wheel, the Pelton wheel, and various turbines. At the conclusion of the paper a good discussion ensued, the following gentlemen taking part therein:—Messrs. E. H. G. Brewster, A.M.I.C.E., M.I.E.E.; E. T. Walrond, A.M.I.C.E.; H. J. Fereday, H. Coward, F. Spark, E. Perrett, W. Cooper Penn, J. O. Ince, J. Taylor, S. à Court, A.M.I.C.E., M.I.E.E., and S. Turner.

PILE DRIVING.

At the meeting of the Society of Engineers on Monday evening, Mr. G. A. Goodwin, president, in the chair, a paper was read by Mr. Henry O'Connor on "Pile Driving."

Mr. O'Connor said he recently heard a paper read before the Society of Engineers on the construction of a certain bridge in which piles were used to carry the foundations of the piers, and noticed what seemed to him a very small duty as being assigned to them, and that some considerable difference of opinion existed as to the amount of the load that could with safety be placed upon piles. Some year or so back the author was himself confronted with the vastly differing formulæ given in the various text-books which refer to this subject, and was induced to make numerous tests, the results of which he would venture to place before this Society, and which he trusts may be of some service to at least a few of the members. Now, according to the different formulæ given, the dead load requisite to force a driven pile further into the ground is calculable, but when the various results obtained show that with a certain pile this amount may vary between 72 tons and 300 tons, and in another case between 81 tons and 1,169 tons, it will be clearly seen that some of the formulæ at least are incorrect. Of these the one which, on first sight, appears to be most simple and most according to the rules usually adopted for calculating accumulated work, is that of Major Sanders; but on further consideration it may be very clearly seen that many other

things have to be allowed for before any formula can be said to give anything like correct or satisfactory results, and which require many other factors to be brought into the calculations.

Trautwine, in his pocket-book, says that Sanders in his rule gives no factor of safety. It seems evident to the author that Trautwine had at the moment forgotten the formulæ for accumulated work, or he would have taken the 8 on the lower side of the line as the factor of safety. As a matter of fact, Major Sanders calculates the force at the moment of impact in the usual manner and divides that by 8, no doubt because he has found by his practice this would be a safe load for a pile. That so great a difference of opinion should exist between men of such eminence as the compilers of these formulæ undoubtedly are, is most certainly an indication that there are many different circumstances governing the question. Of these the one which, it would appear to the author, has the most influence, is the question of the different soils through which the pile may be driven. The different strata which may be met with and through which the pile has to pass do not appear to have been taken into account in any of the formulæ which the author has been able to find. Mr. Morrison's suggestion, that allowance should be made for that portion of the pile which is outside the ground altogether, certainly appears to strike at the point, but not to go quite to the root of the matter. That such an allowance should be made is, without doubt, right, and is a point that few who give the matter even a moment's consideration will cavil at, but if this be the case when the pile is a short length out of the ground, it would appear to the author that the soil which surrounds that portion of the pile which is in the ground, and which is by far the greater part of the length, should be taken into consideration and its resistance to the bending tendencies of the pile allowed for in the calculation. It is this liability to bend which rapidly reduces in such a large proportion the strength of a column as it increases in the ratio of its height to its diameter. A reference was made to a diagram showing by the black line the strength of a hollow C. I. column of 15-inch diameter and 1-inch metal, according to its length, and by dotted line the strength of a 14-inch by 14-inch square pine column. By this the great difference in the strength was readily seen. Now this loss of strength as the height increases is mainly due to the tendency to bend which was before referred to, and if the column were sufficiently strongly stayed at various positions along its length the strength would be considerably increased, inasmuch as the column would then bear the load of the same as if it were only of the height between the parts stayed. The

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in $4\frac{1}{2}$ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

staying properties of each layer or stratum of soil should, it would seem, be taken into consideration when settling any formula for such work, but it may be mentioned that to find out what this is a very difficult matter, and one which can only be done after repeated experiment, but the author would venture to lay before the members a method which he has adopted, and which gives a fairly accurate result. By driving either a trial pile or the first of the series which are to be driven into the ground, and by noting the exact set due to each blow of the falling ram, a fairly approximate estimate of the compressibility of each stratum may be obtained. The author recently had this noted in the case of two 14-inch square pitch pine piles, and gave the result of these tests. The depths of the various strata may be fairly easily determined by the sudden alteration in the distance the pile was driven by the ram. It should be here mentioned that in each case and in every blow a drop of 5 feet was used, so that, as far as the accumulated energy was concerned, it was uniform. Of course the absolute effective blow due to a falling body is lessened as the resistance of the object struck becomes less, and this must be taken into consideration when any calculations are made of the resistance of the ground. Another point which must not be lost sight of is the resistance due to the side friction, and this again brings in another difficult problem, and one which is not very easily solvable. To gain some insight into this the author has had some observations taken on the force necessary to withdraw a 14-inch pitch pine pile. Unfortunately there did not happen to be one which required drawing, which had been driven in exactly the same strata as were to be found in the spot where the pile which was tested at each blow was driven, but those to be removed were situated some few hundred yards away, and had been driven in the bed of the river Thames for the purpose of forming a stage for the upholding and directing of cylinders for a new pier, and also for the erection and building of girders, &c., for the approach to same. They were driven into the mud, which lay at about 15 feet below the finished top of pile, and was about 18 feet thick, then through a thin crust of ballast, and into a sandy silt to chalk at about 40 feet below the top of the piles. They were originally driven by a pile engine with a 30-cwt. ram driven by steam. It may be interesting to note the manner in which it is worked. Steam is connected by means of iron piping with knuckled joints, and finally indiarubber tubing to the top of the ram, which is of cast-iron and hollowed out in the same way as the ordinary pattern cylinder of an engine, but

with ports for inlet of steam, and the exhaust for same on the top, the piston-rod coming through the lower end and resting on the top of the pile. The ports are worked by a long double-ended lever, to each end of which a thin rope is fastened, and which serve to allow the apparatus to be worked from the ground level. In the case under notice the whole machinery was fixed upon a barge and was towed to and fixed at the different positions as required. On the admission of steam the pressure causes the cylinder to rise, the piston in this case being stationary until the required height above the top of the pile is reached, when the steam is shut off and at the same time the exhaust port is opened, when the cylinder, which, as before stated, weighs 30 cwt., is permitted to fall upon the pile and force it into the ground. A very large number of blows can be given with this arrangement in a very short space of time, and a fairly large amount of steam is required. But to return to the withdrawing of the piles. These had been driven some twelve or fifteen months, and had had the wash of the incoming and outgoing tides to consolidate the ground around, which was also rendered harder owing to the weight of water, which at high tide was about 15 feet high above the mud. This no doubt had the effect of making it far more difficult to remove the pile. At first it was proposed to withdraw them by means of a barge weighted at one end and with a short jib at the other, over the end of which the ropes and chains were led to the pile, utilising the rise of the river to lift. This was successful in the case of two or three very near the shore, but it was found that it was necessary on one occasion to let go the tackle as the barge was on the point of sinking. After this experience it was decided to work only at low tide, and to have the barge down upon the mud, lifting at this time by means of a crab on the barge. This worked successfully, but it was found that it took eight men, working on the handles of the crab, pulling with all their power, to start the pile, but after it had moved a foot it was comparatively easy.

Working out the gain by means of the crab, and taking the amount of power expended by the men at 40 lbs. each—the author is aware that the text-books mention only 20 lbs. as the force which a man usually expends when working a handle of a crab, but in this case the men were exerting themselves in no ordinary way, and he is therefore convinced the 40 lbs. taken above is not much, if anything, above the mark—the amount of power necessary to start the pile, allowing 10 per cent. for friction on the gearing, and allowing for the atmospheric pressure, was equal to 16 tons, and this, after deducting the

weight of the pile, shows some 15 tons as the side friction on the pile. As before shown, the resistance of the ground and the side friction would amount to, say, 300 tons when nearly home, and 24 tons, say, when half-way down; therefore, this amount, less the proportionate amount of the side friction according to depth, may be taken as the absolute resistance which the ground at these points would give.

A column of pitch pine, 30 feet long and 14 inches by 14 inches, would carry an ultimate load of say, 640 tons, and at this limit would exert a side pressure distributed along the length of the pile, if the lower end may be assumed to be fixed, equal to 256 tons; now the average resistance of the ground may be calculated by taking a certain number of points in the height and calculating the resistance which the ground would exert, and taking the average of these and the area of the side of the pile, and calculating the proportion of that side to the area of the end, a fairly accurate estimate will be obtained of the resistance of the ground to the bending strain of the pile. Of course, if this resistance be greater than the force exerted in a horizontal direction, owing to the load on the pile, to a sufficient degree to be safe, the ground may be considered hard enough to form a thorough stay to the column.

In very many cases the author is quite sure that if this were taken into consideration the result would be astonishing, especially so when the piles have been driven through soft mud.

Another matter which must not be lost sight of is that if a column were subjected to a load of sufficient weight it would bend considerably before breaking, and although the weight which is thrown on a pile while being driven home by the ram does not nearly reach this load, yet in many cases it is quite half the ultimate breaking load of the column unstayed. As an instance of this, a cast-iron pile 30 feet long and 15 inches diameter of 1-inch metal may be taken; this would break under a load of 664 tons, and the load which would be upon it at the moment of impact, when a one-ton monkey which had fallen 5 feet struck it and gave it a set of one-fifth of an inch, a very ordinary blow, would equal 300 tons, or, say, half the ultimate breaking load. Now the deflection of such a beam at half the breaking strain is equal to about 2.2 inches, and this would cause a shortening of the pile, during the period of greatest load, of about three-sixteenths of an inch, and this on the removal of the load, which only rests momentarily upon the pile, would not be noticed when the set was being measured.

In this way a cause of error is easily accounted for, and it is this fact which renders the usual formula for accumulated work insufficient in the accurate gauging of the load which a pile may carry.

While driving some 164 piles in a new retort-house at Beckton recently some considerable difficulty was found in getting the piles to stand the test specified. It may be mentioned that the piles were of cast-iron, 15 inches diameter outside, and of 1-inch metal, with a circular point about 4½ inches diameter, tapering for about 1 foot 3 inches. It was specified "that the piles should be driven into the gravel to such a point of resistance that the impact due to a monkey weighing 1 ton falling from a height of 5 feet will not exceed a quarter of an inch for four blows from such ram or monkey. Whilst the piles are being driven a hard wooden dolly must be placed between the monkey and the head of the pile to prevent fracture."

A very serious trouble was experienced at the outset owing to the fact that the piles were driven in several cases through the thin crust of ballast without standing the specified test; the skin friction proved of so little good in sustaining the pile that it went right down to the hard chalk, found at about 75 feet from the surface. A number of different means were employed to prevent this. Shoes of the pattern shown were tried with varying success; next a wooden block, 8 inches all ways, was experimented with, and this proved very successful; so much so, that this principle has been adopted and the nose of the pile cast square.

Another point which had to be decided at the time was as to the meaning of the expression a "hard wooden dolly," no mention having been made in the specification as to whether the wood composing the dolly should have the grain running vertically or horizontally. Comparative tests were made, and this showed that a pile which had a set of three-eighths of an inch, due to the last four 5-feet blows of one ton, when the hard wooden dolly was 2 feet 6 inches long and placed vertically, and fitted into a wrought-iron driving cap, had a set of only five-sixteenths of an inch for four blows of the same character when the 16 inches by 16 inches timber was laid directly on to the pile without the interposition of the wrought-iron driving cap. This was no doubt owing to the surface of iron exposed to the dolly only being about 47 square inches, against 176 square inches when the driving cap was fixed on the pile.

A further test was made to see the effect of a dead load

WORKS, ROTHERHAM. Estab. 1854.

upon a pile which had been tested with the 2 feet 6 inches wooden dolly placed vertically over the iron driving cap, and had had a set of three-eighths of an inch only for the four blows. Wrought-iron joists and steel rails were gradually laid on until 100 tons had been placed, and beyond a set of three-sixteenths of an inch, when 20 tons had been put on the pile, taking its bearing upon the ballast, no further subsidence took place.

It was decided to continue the weighting up to 120 tons, when it was observed that the pile had gone down rather less than 1-16th inch. This latter weight, therefore, may be taken to be the amount required to drive the pile the same distance as the last blow of the ram as received by the pile with the wooden dolly vertically between. These cast-iron piles were mostly driven by a machine. In this machine an endless chain is kept continually in motion by a steam-engine, the chain being made of flat links, and the ram having a bolt which can be made by means of a lever to work into the chain; this lever is worked from the ground level by means of a rope, but is only used to drive the bolt into the chain. To release the bolt a bent iron staple is affixed at whatever height may be desired, so that it may just miss the ram on rising, but will engage with the lever on its side, and forcing it outwards withdraw the bolt and allow the ram to fall by its own weight and strike the pile. This machine appeared to work well, and a considerable quantity of piles were driven by it, and these at a very rapid speed, as frequently four piles 30 feet long have been driven to the test in one day.

A short while back the author read a description of some piles which had recently been driven in America, and was astonished at the enormous drop given to the ram, which was in some cases as much as 50 feet, and the weight of which varied from 2,800 lbs. to 3,200 and 3,800 lbs. Taking an average of these, say 3,300 lbs., and working out the accumulated energy imparted by such a blow when the set of the pile was 1½ inches, which it is stated was sometimes the case, this would equal over 589 tons. One is not surprised to hear that 8 per cent. of the heads crushed, despite an iron cap, and that the vibration of the blow was easily felt at a distance of some 400 feet.

Borings showed 10 to 20 feet of rubbish recently shot, next blue clay and quicksand down to 60 feet, then rock. Seventeen hundred piles were driven at 25½-inch centres, averaging 51 feet long, and were 16 inches square at the butt, tapering up to 11 inches at the other end.

The author would, however, observe that from his experience the increase of the blow, due to an increased fall of the ram, is not, in the case of a pile engine, in direct proportion to the height of the fall, this being probably due to the friction on the guides which keep the monkey from deviating from the direct line to the head of the pile.

Having made several tests to obtain an average of the extent to which this friction lessened the blow, he has found that with a pile which was being driven at an even rate into the ground with a 5 feet drop, when given a blow with the same ram and with a 7 feet 6 inches drop, the loss by friction was equal to some 6½ per cent., and with a further increase to a 10 feet drop the friction reduced the efficiency of the blow some 11½ per cent. The author, while he has not been able to propound a new formula for the calculation of the weight which may be safely placed upon piles, which would be correct under all circumstances, has endeavoured to point out some few methods of arriving at what matters should be taken into consideration when any particular calculations for the purpose are about to be made. For his own part, he should have no hesitation in placing 40 tons upon a 14-inch square pitch pine pile which had been driven into the soil to the test which has been previously mentioned as specified for the iron piles, and has been given to understand that some time back such a pile was loaded with 80 tons without showing any signs of sinking. With regard to the cost of pile-driving, as compared with excavating and timbering, a few figures may be of advantage. The cost of a 12-inch diameter iron pile of 1-inch metal, driven to a depth of 30 feet and filled with concrete, would be about 13½ s., and the cost of a 12-inch by 12-inch pitch pine pile, driven to the same depth, would be about 4½. This would have to be compared with the smallest hole that can be satisfactorily excavated, and this may be taken as 6 feet by 5 feet, and would cost for a depth of 30 feet, including timbering, use of timber and concreting, about 31½. That the last method of forming foundations mentioned would sustain a much greater load than either of those previously mentioned is easily understood; but there are many cases in which a smaller load has to be carried, and in these cases piles may be advantageously used.

In working out the strength of cast-iron piles, a diagram recently got out by the author for finding the safe load which might be placed on cast-iron columns, and which was published in *Work*, may be usefully employed. The curve laid down in the diagram is the result of an enormous number of calcula-

Shorland's Inlet and Outlet Ventilators in every Design.

tions, which were most carefully checked. I may mention that the safe load has been taken as one-tenth of the breaking load.

The method of using this diagram is as follows:—Having decided upon the approximate diameter of the columns and noted the number of diameters in the height, take the line opposite the corresponding number on the left-hand side of the diagram, and follow it until it is crossed by the curved line, and from the point where these two lines cut proceed vertically downward to find what division of the ultimate crushing load is necessary as a factor of safety.

By multiplying this divisor by the weight required to be carried, and dividing this by forty-nine (the number of tons which will crush a square inch of cast-iron), the necessary sectional area in square inches may be obtained.

INSTITUTION OF CIVIL ENGINEERS.

At the ordinary meeting Mr. Alfred Giles, president, in the chair, a paper was read relating to the construction of the Liverpool Overhead Railway, by Mr. J. H. Greathead, M.Inst.C.E. He began with a history of the undertaking, which was the practical solution of a difficulty first experienced forty years ago, namely, the provision of better communication for passengers along the frontage (now extending to $6\frac{1}{2}$ miles) of the Liverpool Docks. The elevated railways in New York had been highly successful in meeting the wants of the travelling public, but were attended by several inconveniences. There were no parapets and no floors, the sleepers being placed directly on the top flanges of the girders. The result was that, as the railways were worked by steam locomotives, cinders, oil and water dropped into the street; fine shavings from the rails and tires fell on the foot passengers, and in one case, at least, a locomotive had fallen bodily into the street. Mr. A. G. Lyster, who had minutely studied the New York system and reported thereon to the Liverpool Corporation, had expressed himself in favour of an overhead electrical railway, and after some delay an Act was obtained in 1882 by the Mersey Dock Board for the construction of a double line of 4 feet $8\frac{1}{2}$ inches gauge. The estimate for this, fully equipped and worked by electricity, was 466,000*l*. The structure was intended to consist of plate girders, with overhanging continuous footways having parapets of iron lattice-work, with the rails laid upon greenheart planking, the whole being supported by columns of

partial lattice-work placed in the normal structure, one on each side of the lines of dock railway. Owing to the fact that many influential members of the Dock Board were unwilling to embark upon railway management, the undertaking was in 1887 leased to the present Liverpool Overhead Railway Company, by which the line was constructed.

The length of railway at present worked was 5 miles, but would ultimately be $6\frac{1}{2}$ miles. In the structure decided upon the columns were placed vertically under the ends of the main girders, about 22 feet apart from centre to centre, allowing sufficient width for two lines of standard gauge with the usual 6-foot way and admitting the use of carriages 8 feet 6 inches wide. Local circumstances in many cases did not, however, admit of the columns being placed immediately upon the main girders, and the latter were then carried upon cross-girders outside the line of columns. For considerable lengths also the columns had to be embedded in the boundary and warehouse walls. Owing to the presence of the dock lines below, cross-bracing of the piers in the usual way was impossible, and it was necessary to give to the columns and to the shallow cross-bracing connecting them at the top sufficient strength and rigidity to resist the lateral stresses due to wind-pressure, and, on curves, to the centrifugal force resulting from the motion of the trains.

In carrying out the works no special difficulties arose in connection with the foundations of the piers. In places where rock was not reached, masses of concrete were deposited of sufficient extent to insure the maximum load on the base not exceeding one ton per square foot. In excavating for the foundations the sill of the first dock made in Liverpool was discovered, and several lengths of old water pipes, consisting of trunks of trees bored out and fitted together, were brought to light. Owing to the railway being placed immediately over the dock-lines, the latter were in many cases diverted, straightened and improved. The columns supporting the viaduct consisted of two steel channel bars rivetted to two steel plates, forming a box column with all the rivet-heads outside. These columns were grouted into cast-iron sockets bedded in and bolted through the blocks of concrete. Cast-iron bumpers filled with cement concrete protected the columns from injury from passing waggons. The normal span was 50 feet, but longer spans up to 98 feet and shorter ones of about 30 feet were required in some cases. Up to 75 feet span the height of the girders above the rail-level did not exceed the platform height, and plate-girders were used. In longer spans bowstring-girders were used. Between the

girders was fixed Hobson's arched-plate flooring, consisting of 5-16th inch plates bent to a radius of 12 inches, with a flat surface 6 inches wide on the top, rivetted to intervening T-bars, and made water-tight by asphalt run in the V-channels between the arches. The structure was so designed that the spans could be put together and rivetted up with floor complete at one or both ends of the railway, and be then transported over the completed portion of the structure to be placed in position. A special form of erecting-machine was provided, consisting of two lattice-girders standing upon legs resting on the ground at the front end, and at the hinder end upon a carriage running on rails on the viaduct. These girders were placed at such an altitude as to allow the trolley carrying the succeeding span to be rolled along underneath them. On these lattice-girders were placed two travelling-cranes, so arranged as to lay hold of the spans on arrival, run them forward, and deposit them in their permanent position upon the columns which had been erected in advance. The average time occupied by this operation was one hour per span.

In the course of the work several opening bridges had to be provided which were described and illustrated in the paper, as were also the stations, permanent-way and rolling-stock.

The total quantity of iron and steel in the structure was about 22,000 tons. The total capital cost, including equipment and all other charges, had been 550,000*l.*, or about 90,000*l.* per mile of railway. The line was formally opened by the Marquis of Salisbury on February 4, 1893, and was opened for traffic on March 6 following. The electrical system of working was completely successful, a five-minute service of trains being maintained with perfect regularity and without mishap of any kind. On the last August Bank Holiday about 40,000 passengers were carried in the space of eight hours.

VAUXHALL BRIDGE.

A REPORT on the rebuilding of Vauxhall Bridge has been prepared by the bridges committee of the London County Council. They say:—We have considered what means of transit across the Thames should be included in the Council's Improvements Bill to be introduced into Parliament during the session of 1895. There appear to us to be several schemes of pressing importance, but the most urgent are those for the reconstruction of Vauxhall and Lambeth Bridges. The consideration of these two crossings cannot very well be separated.

The question which has engaged our attention is whether one of these two bridges should be constructed before the other, and if so which, or whether it would be expedient to obtain powers for the reconstruction of both bridges in the same session of Parliament. Viewed as a public improvement, whether with reference to the road traffic or to that upon the river, in our opinion there can be no doubt that Vauxhall Bridge claims the more immediate attention. The reconstruction of this bridge involves no extensive system of street improvement, no opposition is likely to be encountered, nor would it necessitate any further expenditure for the approaches to render it at once and for all time of advantage to the public. The width of 80 feet having been decided upon, the reconstruction of the bridge would at once place two important railway stations, Vauxhall and Victoria, in immediate communication by tramway, which in itself would, we think, be of considerable public importance. With regard to the traffic over Lambeth and Vauxhall bridges, we find that in July 1891 the maximum for Lambeth Bridge varied from 118 to 130 vehicles per hour, whereas over Vauxhall Bridge the maximum varied from 720 to 721 per hour, and on comparing the traffic over Vauxhall Bridge with that taken in 1890 at Norfolk Street, Strand, it appears that the traffic over the bridge amounts to about 64 per cent. of that passing along the Strand. Taking the above figures, we may say that as regards traffic Lambeth Bridge is to Vauxhall Bridge in the proportion of about 1 to 7, and certainly, if we say that Lambeth Bridge accommodates not more than one-sixth of the traffic which passes over Vauxhall we shall be within the truth. Looking at the direction of the principal thoroughfares on both sides of the river leading to and from Vauxhall, Lambeth and Westminster Bridges, it appears to us that this disparity of traffic is likely to continue until some new line of thoroughfare is made from St. George's Circus over Lambeth Bridge in the direction of Victoria Street or the Victoria Station. The cost of a new bridge at Vauxhall, 80 feet wide, with gradients of 1 in 40, would be 380,000*l.*, including 30,000*l.* for a temporary bridge, and the property charges are estimated by the valuer at 74,000*l.* The latter will be incurred entirely on the south side of the river in respect of property opposite the gas works. Lambeth Bridge, with a width of 80 feet, and gradients of 1 in 30, would cost 386,000*l.* to rebuild, inclusive of 30,000*l.* for a temporary structure, and if the property to be acquired be limited to that necessary for widening the approach roads to 60 feet, with gradients of 1 in 30, its

estimated cost as given by the valuer would be 95,100*l.* net, so that we get the following figures comparatively for the two bridges:—Total cost of Lambeth Bridge, 481,100*l.*; total cost of Vauxhall Bridge, 454,000*l.*—a difference in favour of Vauxhall Bridge of 27,100*l.* But this does not fully represent all the circumstances of the case. The above expenditure on Vauxhall Bridge would create at once an important public improvement, while the larger expenditure on Lambeth Bridge would require to be supplemented in the future by some very extensive and costly widenings, embracing Millbank Street, Horseferry Road, with a new street in addition thereto, and also Church Street, Lambeth; until these improvements were effected it could not be said that the public would reap the full benefit of the widened bridge. The cost of these widenings would probably amount to something near the cost of the bridge. We think it advisable to inform the Council of the present stability of the two bridges. The superstructure of Vauxhall Bridge would in all probability remain safe for many years provided the foundations remained intact. It is in its foundations that the bridge is weak. These were strongly reported against by Sir Frederick Bramwell and Sir Joseph Bazalgette some years ago, and since then the foundations of the piers have been protected by blocks of iron slag. The piers have recently been examined by a diver, who found that some of the deposited slag had been removed, but not to such an extent as to expose the timber, and we are now waiting for soundings to be taken above and below the bridge before reporting in further detail to the Council. The scour through the arches of the bridge must inevitably in course of time undermine the piers and the whole structure will then be liable to subsidence. We do not, however, apprehend that there will be any sudden collapse of the bridge, as it is anticipated that warning of impending failure would be given; at the same time, however, we think that the rebuilding of the bridge should not be much longer postponed. As regards Lambeth Bridge, it was undoubtedly in a shaky condition at the time it was taken over by the late Board, but the alterations and improvements subsequently carried out have, we are advised, placed it beyond the risk of immediate failure, especially as the weight of loads allowed to pass over it is restricted. We must, however, express our opinion that the bridge should be reconstructed at an early date. Upon a review of all the circumstances, we have come to the conclusion that Vauxhall Bridge should be rebuilt as soon as possible, and we therefore recommend—

"(a) That the Council do apply to Parliament for power to rebuild Vauxhall Bridge at an estimated cost of 454,000*l.*, including 30,000*l.* for a temporary timber bridge, 50 feet wide, to cross from the western end of the Albert Embankment to Millbank.

"(b) That the parliamentary committee, in conference with the bridges committee, be instructed to prepare a bill, to be introduced in the Session of Parliament for 1895, authorising the rebuilding of Vauxhall Bridge."

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

3513. Michael Terrance Fitzpatrick, for "Improvements in sanitary drain-pipes."

3527. William Stanford Foster, for "Improvements in methods of raising and lowering sash windows."

3544. Richard Baxendale, for "Improvements in or connected with chimney-pots and the like."

3576. Harry Brocklesby, for "Improvements in ball-cocks."

3608. Henry Thomas Johnson, for "Improvements in exhaust ventilators."

3636. Alfred Julius Boulton, for "Improvements in fire-escapes."

3646. Sarah Ann Fairall, for "A new or improved sash-fastener."

3659. Edwin James Preston, for "Improvements in ventilating covers or manhole doors for sewer side entrances, cellar areas and the like."

3689. James Aitken, for "Improvements in latches for window-sashes."

3708. John Mair, for "Improvements in and relating to window-sashes."

THE Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

GOOLE.—April 16.—Competitive Designs invited for a Covered Market, with Shops fronting Boothferry Road and Estcourt Terrace, with a Board-room, necessary Clerks', Surveyors', Inspectors', Collectors', Gas and Water and other Offices, with the Necessary Anterooms, Storerooms and Lavatories, to be Erected upon the Land and Premises, in Goole, abutting upon the before-mentioned Streets. Mr. George England, Local Board Offices, The Exchange, Goole.

KIRKCALDY.—March 17.—Plans, &c., are invited for proposed Beveridge Public Hall, Free Library and Adam Smith Memorial Hall, &c. Mr. W. Roy Spears, Town Clerk.

LANCASTER.—May 1.—Competitive Drawings invited for Extension of Markets, and Erection of a New Hotel. Mr. John Cook, A.M.I.C.E., Town Hall, Lancaster.

LLANDUDNO.—May 31.—Designs are invited for Municipal Buildings. Mr. E. P. Stephenson, A.M.I.C.E., Llandudno.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150l. and 50l., premium to merge. Mr. H. H. Hicknott, Town Clerk.

CONTRACTS OPEN.

ABERDEEN.—March 17.—For Additions to Ardmeallie Houses. Messrs. Matthews & Mackenzie, Architects, Aberdeen.

ABERGAVENNY.—March 29.—For Building Stabling, Cartsheds, Workshop and other Works. Mr. J. Haigh, Town Surveyor, Abergavenny.

ACKWORTH (YORKS).—March 20.—For Construction of a Covered Reservoir, Providing and Laying the Cast-iron Pipes, Sluices, Fire Hydrants, &c. Mr. Geo. Hodson, M.I.C.E., F.G.S., Bank Chambers, Loughborough.

BARNSELY.—March 19.—For Additions to Premises, Monk Bretton. Mr. Herbert Crawshaw, Architect, Regent Street, Barnsley.

BARTON-ON-HUMBER.—March 17.—For Restoration of Bonby Church. Mr. C. Hodgson Fowler, Architect, The College, Durham.

BELFAST.—March 23.—For Alterations, Imperial Hotel. Messrs. Young & Mackenzie, Architects, Donegall Square East, Belfast.

BEXHILL.—March 16.—For Building Local Board Offices, Fire Engine Station, &c. Mr. Henry Ward, Architect, 8 Bank Buildings, Hastings.

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building.

All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

THE ELECTRIC BLACKMAN.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW.

BIRKENHEAD.—March 19.—For Boundary Walls, &c., for Destructor Site. The Borough Engineer.

BLACKPOOL.—March 22.—For Building Police Station. The Borough Surveyor.

BLYTH.—March 16.—For Building Board Schools. Mr. J. H. Morton, Architect, 50 King Street, South Shields.

BOTTOM, DORSET.—March 27.—For Erection of Five Dwelling-houses. Office of Works Department, 21 Craven Street.

BRADFORD.—March 16.—For Building Stables and Alterations to Turf Tavern. Messrs. H. & E. Marten, Architects, Charles Street, Bradford.

BRADFORD.—March 16.—For Building House and Shop and Thirteen Houses. Mr. A. Sharp, Architect, Albany Chambers, Market Street, Bradford.

BRIGHTON.—March 29.—For Constructing a Concrete Groyne, Storm-water Outlet, and an Overflow Chamber on the Beach, opposite Western Street; for Constructing a Storm-water Outlet and Making Additions to the Existing Groyne on the Beach opposite the Old Steine; for Constructing about 980 Yards of Brick Sewers, 8 Feet in Diameter, 562 Yards of Brick Sewers of Smaller Dimensions, and certain Pipe Sewers. Mr. Francis J. C. May, C.E., Town Hall, Brighton.

BURNLEY.—March 27.—For Building Three Police Stations. The Borough Surveyor.

BURTON-ON-TRENT.—April 5.—For Building Infectious Diseases Hospital. The Borough Surveyor.

BURY.—March 21.—For Alterations to Schools. Mr. D. Harding, Architect, Silver Street, Bury.

CAMBRIDGE.—March 19.—For Construction of a Sewage Pumping Station and Destructor Building in connection with Sewage Pumping Installation. Mr. John T. Wood, M.I.C.E., 3 Cook Street, Liverpool.

CAMBRIDGE.—March 19.—For Construction of a 24-inch Cast-iron Raising Main. Mr. John T. Wood, M.I.C.E., 3 Cook Street, Liverpool.

CARDIFF.—March 17.—For Rebuilding Merchants' Exchange. Mr. E. W. M. Corbett, Architect, Cardiff.

CARDIFF.—March 21.—For Building Sewer Ventilating Shaft (40 Feet High). The Borough Engineer.

CARDIFF.—April 11.—For Building Head Post Office. The Secretary, H. M. Office of Works, 12 Whitehall Place, S.W.

CHERTSEY.—March 19.—For Building Infirmary and other Additions to Workhouse (confined to Local Builders). Mr. C. Welch, Architect, London Street, Chertsey.

CHESHUNT.—March 26.—For Construction of about 3,200 Yards of Sewers. Mr. Samuel Towlson, Turner's Hill, Cheshunt.

COLCHESTER.—March 17.—For Erection of Iron Mission-room. Mr. Charles E. Butcher, Architect, 2 Queen Street, Colchester.

CREWE.—March 21.—For Additions to Schools. Mr. J. A. Atkinson, Architect, Hightown, Crewe.

DARNELL.—March 17.—For Building House, Offices, &c. Mr. E. Winder, jun., Architect, Wharf Street, Sheffield.

DERBY.—March 29.—For Building County Council Offices. The County Surveyor.

EASTLEIGH.—March 22.—For Gas Engines, Pumps, &c. Mr. H. J. Weston, Engineer, 24 Portland Street, Southampton.

ECCLES.—March 17.—For Boilers, Engines, Pumps and other Machinery for Sewage Farm. Mr. L. Hinnell, Engineer, 15 Mawdsley Street, Bolton.

FLIMBY.—March 21.—For Building House. Mr. Wallace Hodgson, 3 High Field Place, Flimby.

GLASGOW.—March 17.—For Gate Lodges, Waiting-rooms, &c., Botanic Gardens. The City Engineer, 64 Cochrane Street, Glasgow.

GLASTONBURY.—March 30.—For Erection of Police Buildings. The County Surveyor, 1 Belmont, Bath.

GOOLE.—March 17.—For Building Premises for the Goole Times Company. Mr. H. B. Thorp, Architect, Goole.

HARROGATE.—For all Trades (Joiner excepted) required in the Erection of Two Houses, Victoria Avenue and East Park Road, for Mr. Thos. Linskill. Mr. T. Butler Wilson, F.R.I.B.A., Architect, 12 East Parade, Leeds, and Harrogate.

HAVERIGG.—March 24.—For Building Parsonage. Mr. A. E. Bradley, 15 Horn Hill, Millom.

HONITON.—March 19.—For Restoring Tower of Broadhembury Church. Mr. G. H. Fellowes Prynn, Architect, 6 Queen Anne's Gate, Westminster.

HOO ST. WERBURGH.—March 19.—For Building Infants School. Mr. G. E. Bond, Architect, Victoria Buildings Rochester.

The largest and best variety of Fanlights and Sash Openers, &c. to suit all requirements, viz., details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent
Ventilating Apparatus for
Continuous Sashes of
Lantern Lights,
Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 208.
Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

ISLINGTON.—March 21.—For Electrical Plant and Machinery. Mr. Albert Gay, Vestry Hall, Upper Street, Islington.

KENDAL.—March 16.—For Additions to St. Thomas's Schools. Mr. Stephen Shaw, Architect, Kendal.

KETTERING.—March 24.—For Building Board School. Messrs. Gotch & Saunders, Architects, George Street, Kettering.

LANDPORT.—March 17.—For Building Offices and Printing Works for the *Hampshire Telegraph*. Messrs. Rake & Cogswell, Architects, Prudential Buildings, Landport.

LANDRAKE.—March 22.—For Building Schoolmaster's House. Mr. D. Ward, Architect, 8 Courtenay Street, Plymouth.

LARNE.—March 20.—For Royal Naval Reserve Battery and Drill Hall. Mr. P. J. Tuohy, Secretary, Office of Works, Dublin.

LEEDS.—March 21.—For Construction of Underground Conveniences. The City Engineer.

LEICESTER.—April 3.—For Preparing the Site, the Construction of a Concrete, Puddle and Earthen Dam or Embankment for a Storage Reservoir to contain about 500,000,000 Gallons and for Road Diversions, the Tunnel Outlet and Valve Tower and Valve House in connection with the Swithland Reservoir. Mr. J. Beverard, M.I.C.E., 6 Millstone Lane, Leicester.

LINTHWAITE.—March 27.—For Alterations to Church. Mr. C. Hodgson Fowler, Architect, The College, Durham.

LONGTON.—For Fitting-up Lavatory, W.C.s and Urinals at Market Hall. The Borough Surveyor.

LUDGVAN, CORNWALL.—March 26.—For Rebuilding and Alterations at and Additions to Commercial Hotel. Mr. J. W. Trounson, F.R.I.B.A., F.S.I., Architect, Penzance.

MALMESBURY.—March 24.—For Construction of Brick Gasholder Tank. Mr. James A. Jones, Malmesbury.

MANCHESTER.—March 19.—For Building Offices, House, Stables, Boundary Walls, &c., at Gas Station. Messrs. Darbyshire & Smith, Architects, 17 Brasenose Street, Manchester.

MANCHESTER.—April 4.—For Building Inland Revenue Office. H.M. Office of Works, 12 Whitehall Place, S.W.

MILLBROOK.—April 2.—For Building Board School, House, &c. Mr. A. F. Gutteridge, Architect, 9 Portland Street, Southampton.

MORLEY.—March 29.—For Building Shop and Eight Houses. Mr. G. B. Clegg, Architect, Morley.

NANTYMOEL.—March 21.—For Building Infant School. Mr. Jacob Rees, Architect, Pentre, Rhondda.

NEATH.—April 2.—For Alterations to Board School. Mr. T. C. Wakeling, Architect, Merthyr.

SALFORD.—March 19.—For Building School Board Offices. Messrs. Woodhouse & Willoughby, Architects, 100 King Street, Manchester.

SETTLE.—March 17.—For Additions to Police Station. Mr. J. Vickers Edwards, County Surveyor, Wakefield.

SOUTHAMPTON.—March 29.—For Building Engineering Laboratory. The Borough Engineer.

ST. ALBANS.—March 20.—For Rearranging Lavatories and Drains at Workhouse. Mr. T. Foster Woodman, Architect, St. Peter's, St. Albans.

STAFFORD.—March 19.—For Building Electric-Lighting Station. Mr. J. F. Bell, Engineer, Gasworks, Stafford.

ST. HELENS.—March 19.—For Supply of Materials for a Period of Twelve Months. Mr. Wm. John Jeeves, Town Hall, St. Helens.

ST. JUST, CORNWALL.—March 23.—For Alterations and Additions to Pendeen Board Schools. Mr. J. W. Trounson, F.R.I.B.A., F.S.I., Architect, Penzance.

TORQUAY.—March 27.—For Extension of the Existing Fish Quay by the Erection of about 300 Lineal Feet of Concrete Walling, Filling behind Same and Paving Deck with Portland Cement Concrete; the Erection on the afore-mentioned Quay of Offices and Coal and Fish Stores, &c., having a total Superficial Area of about 20,000 Feet. Mr. Henry A. Garrett, Town Hall, Torquay.

TOTTENHAM.—March 27.—For Making-up Sutherland Road, Ida Road, Hartington Road, Roslyn Road, Burlington Road, Kemble Road, Etherley Road (part of), Eckington Road, Hampden Road (remainder). Mr. P. E. Murphy, 712 High Road, Tottenham.

TOTTENHAM.—March 27.—For the Supply and Delivery on the Works of about 1,150 Tons of 16-inch Cast-Iron Water Main, with all Necessary Bends, Valves, &c. Mr. P. E. Murphy, 712 High Road, Tottenham.

HALLIDAY'S CLAPTON LIGHTS.

Simple, Powerful, Economical. Reflection and no Complication.

OPEN TOP, AS SHOWN, OR VENTILATING. PLAIN OR ORNAMENTAL.

Much used in Places of Worship, Lecture Halls, Board Schools, Shops, Large Offices, Markets, &c.

Suitable for wherever a Very Powerful, Well Diffused, Soft, Economical, and

Easily Managed Gas Light is desirable. Made in Five Sizes.

HONoured WITH SUNDRY IMITATIONS.

Seven years from Invention up to April 1890 over 11,300 sent out. But

Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong.

R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON) — "You can find all the furniture at Hewetsons', or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations, Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES

completely Furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE

is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

ARCHITECTS' Plans and Designs exactly and faithfully worked to.

Tenders Free for ELECTRIC LIGHTING.

SANITARY Work, STRUCTURAL Alterations, and every kind of Interior & Exterior DECORATIONS.

440.—English Carved Oak Writing Table, Leather Top, on Casters, £15 10s.

Without Drawer and Pigeon-holes on Top, £10 10s.

N.B.—House and Estate Agency Offices (213 Tottenham Court Road),
SURVEYORS, AUCTIONEERS AND VALUERS.

BUILDING AND BUILDERS.

A NEW Wesleyan chapel has just been opened at Newbridge, Cornwall, by the Rev. W. H. Thompson, chairman of the district synod. Mr. J. W. Trounson, F.R.I.B.A., F.S.I., Penzance, was the architect.

At the meeting of the Glasgow Dean of Guild Court, permission was granted to Lord Provost Bell and the committee of the Association for the Promotion of Art and Music in Glasgow to erect the new Fine Art Galleries in Kelvingrove Park.

THE annual meeting of the Bolton Master Builders' Association has just been held at the offices, Chancery Lane, Bolton. In the absence of the president, Mr. Wm. Lee, through illness, Mr. J. H. Marsden was called to the chair. The committee's annual report, presented by the secretary, Mr. F. W. Briscoe, showed that the work of the past year had been very great, no fewer than fifty-three meetings of the committee and branches having been held. The report stated that the benefits of the Association had been abundantly manifested. It expressed the hope that special efforts would be made so as to insure the delegates of the Master Builders' Association of Great Britain an interesting meeting and hearty greeting on the occasion of their visit to Bolton at the half-yearly meeting to be held in July next.

FUNDS are being raised for St. Mary's Church, Shrewsbury. The spire, which was being repaired, was unable to resist the violence of the late gale, gave way, and precipitated itself into the church. The entire nave roof, which was of exceptional interest, has been demolished, but the windows have escaped. St. Mary's is one of the finest churches in Shropshire, and the oldest in Shrewsbury, its foundation going back to 980. The spire, as distinct from the tower, was of unusual height, and ranked third among English spires.

GALATEA.

TRADE NOTES.

MR. W. F. NEEDHAM, of Branstons Street Works, Birmingham, has recently brought into prominent notice some of the uses for decorative purposes to which specially prepared and varnished split bamboo can be applied, especially on dados, friezes, walls and ceilings, as illustrated in our advertising columns of this number. It is undoubtedly very attractive, requires no great skill in fixing, and is also economical as to cost. It is in lengths of 6½ feet, the diameter varying from ¾ inch to 2½ inch. Mr. Needham's catalogue and price-list, we may add, will well repay the trouble of examining the illustrations.

THE annual meeting of the Bath Stone Firms, Ltd., has just been held at the Grand Pump Hotel, Bath. The twelfth half-yearly report was submitted, which recommended payment of a dividend of 8¼ per cent. for the past half-year, making 7½ per cent. for the whole year. Mr. J. C. Pictor, the chairman, in moving the adoption of the report and accounts, said it was the most satisfactory of any presented. The dividend for the last half-year of 1893 of 8¼ per cent. made the dividend for that year 7½ per cent., which was seven-eighths per cent. more than was paid in 1892, and half per cent. more than the highest dividend paid since the establishment of the company. The directors had only divided *bona fide* profits actually earned, and the increase was due to larger sales and to income derived from invested capital. The report was adopted.

THERE is a branch of skilled artifice that is limited to comparatively few firms, for it requires different treatment altogether from mere design and workmanship. The knowledge of religious symbols and their technique is absolutely essential in work of the kind. We recently had the opportunity of inspecting the art workshops of Mr. Walter V. Evans, of 140 Clerkenwell Road, E.C., entirely devoted to ecclesiastical work. Mr. Evans is himself a practical workman and designer, and has been responsible for some of the best memorial and general metal-work that has adorned our churches.

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of 3½ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (*i.e.* the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.	SIEMENS' BURNERS, 23 calories per candle per hour.
ARGAND " 44 " " " " " "	WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

We inspected some beautiful specimens of work, massive, imposing, and some exquisitely delicate, in all the different shades of metal—silver, electroplate, brass, copper and iron. Mr. Evans will be glad to submit specimens of work to any of our readers interested in church decoration.

THE tender of Messrs. Armitage & Hodgson, of Leeds, for building offices at Wakefield for the West Riding County Council is recommended for acceptance, the cost being about 77,000*l.*

THOSE interested in good casters for furniture are afforded, by Mr. Henry Beckett Harding, the inventor, patentee and manufacturer of "Harding's Patent Globe Casters," an opportunity of seeing and testing them at Nos. 19 and 21 Bury Street, Bloomsbury. We have before this explained the advantages and principles of the globe casters.

THE works committee of the School Board for London have just passed the following resolution with regard to the employment of registered plumbers:—"That it is desirable that plumbers employed by the Board should hold a certificate of the Plumbers' Company."

THE new infectious hospital buildings, Cardiff, which are now nearing completion, are being warmed and ventilated throughout by means of Shorland's patent system. In each of the large wards are fixed one of Shorland's patent double-fronted Manchester stoves with descending smoke flues, and in each of the smaller wards one of Shorland's patent Manchester grates. The whole of the hospital buildings are ventilated by means of Shorland's patent exhaust roof ventilators and vertical inlet tubes, the work being carried out by Messrs E. H. Shorland & Brother, of Manchester.

A FINE piece of wrought-iron screen-work, designed by Mr. Pearson as a side screen for the choir of Peterborough Cathedral, has just been completed. The screen is treated very simply, with upright parallel bars filled in with rich scroll-work in the lower portion up to about the level of the eye, and with narrower band of similar work along the top, also with a fine cresting and frieze. The scroll-work is simple in detail but designed in the true spirit of Mediæval wrought-iron work, and is very effective *en masse*. This excellent piece of workmanship has been produced at the forges of Messrs. White & Sons, Oxford Street, London.

THE Holland (Lincolnshire) County Council, at Spalding yesterday, accepted a contract for the supply of 6,000 tons of granite from a Belgian firm.

TENDERS have been submitted to the Clerkenwell Vestry for building the new Parochial Hall. The original estimate was 12,000*l.*, but the Vestry decided to increase this estimate by 910*l.* extra cost involved by paying the trade-union rate of wages, and also for using English goods throughout instead of allowing the use of foreign manufactured goods. Nine contractors tendered for the work, and Messrs C. Dearing & Son, of Islington, were successful, with 14,724*l.* 18*s.* Mr. Evans Vaughan, of the Lowther Arcade, is the architect.

ELECTRICAL.

AT the meeting of the electric-lighting committee of the Edinburgh Town Council, the following were selected to be recommended to the Town Council from among ninety-eight applicants for the post of electrician to the Corporation:—Mr. R. A. Chattock, Metropolitan Electric Supply Company, Limited, Amberley Road Station, London; Mr. George B. Dunn, Metropolitan Electric Supply Company, Sardinia Street Station; Mr. E. W. Monkhouse, M.A., Westminster Electric Supply Corporation, Limited, Eccleston Street, Falkirk.

AT the meeting of the Stafford Town Council, it was reported that a letter had been received from the Local Government Board giving their formal sanction to the borrowing of 20,000*l.* by the Corporation for a term of twenty-five years, and to the use of certain land at the gas works for the purpose of electric lighting.

THE Local Government Board have sanctioned an application of the Wolverhampton Town Council to borrow 30,000*l.* to carry out the electric-lighting scheme.

AT a general meeting of the Northern Society of Electrical Engineers, held at the Palatine Hotel, Manchester, two papers were read—one on "Notes on designing a system of underground electric mains," by Mr. John H. Rider; and the other on "The various systems of underground mains, and the methods of laying the same," by Mr. S. V. Clirehugh.

SOME additional works have been rendered necessary on the eastern arm of the new harbour at Dover, through geological "faults" discovered in the sea bed, which will entail an estimated further expenditure of 30,000*l.* on this section of the operations.

Two Tinted Ink Photographs (size 18½ in. by 13½ in.), may now be obtained, price 1*s.* each. Free by post, carefully packed in patent roller, 2*s.* 3*d.*—GILBERT WOOD & CO., 175 STRAND, LONDON, W.C.

VARIETIES.

AN inquiry has been held by the Local Government Board into the application of the Gainsborough authorities for sanction to borrow 600*l.* for the improvement of their public baths, and 600*l.* for works of private street improvement. There was no opposition. The Inspector strongly advocated washhouses in addition to baths.

THE Mersey Dock Board have under consideration a proposal to raise the quay of the north side of the Egerton Dock, Birkenhead, and to erect a corrugated iron shed, at a cost of 13,350*l.*, and to raise a portion of the quay on the north side of the Hornby Dock, and erect a shed 900 feet long and 150 wide, at an estimated cost of 51,500*l.*

THE Mile End Board of Guardians have entered into a contract for the purchase of several acres of land at North Weald, Essex, on which to erect cottage homes for between 300 and 400 children. Each home will accommodate twenty-five children, and will be in charge of a foster-father and foster-mother. The boys will be taught shoemaking, carpentering and tailoring, and will work on the land.

THE Greenock Harbour Trust have agreed to grant to an oil company a ten-years' lease of two acres of ground at the James Watt Dock at 200*l.* per year. The Harbour Trust also agreed to expend 4,500*l.* on the erection of a jetty, tanks, stores, cooorage and other buildings, if the company gives a guarantee that no less a quantity than 20,000 tons would be imported each year during their lease.

AT Bracknell an inquiry has been held by the Local Government Board to consider an application for a provisional order to purchase 22½ acres of land for sewage disposal works. Arrangements had been made by the Authority with the owners of the two pieces of land required. The agreements were not signed, and the inquiry was held as a matter of form. Mr. W. H. Radford, of Nottingham, engineer to the scheme, attended. The sewage is to be purified by irrigation, two pumping stations being necessary, one at each end of the town.

THE corporation of the Port Works of Barcelona have issued a circular giving the conditions upon which tenders will be received in that town, up to April 16 next, for the construction of a floating dock (Clarke and Stanfield system) for the harbour of Barcelona. Copies of this circular (in Spanish), together with a plan of the proposed dock, may be seen on

application to the Commercial Department of the Foreign Office between the hours of eleven and five.

AN inquiry was held on the 1st inst. by Mr. John Bird Clarke, for the Local Government Board, into an application by the Barnoldswick Local Board to borrow a loan for works of sewerage and sewage disposal. Dr. Holt, of the firm of Messrs. Brierley & Holt, engineers, explained the scheme. There was no opposition to the scheme, and the inquiry terminated in the usual manner.

THE district committee of the Kingussie County Council have decided at once to advertise for estimates for the construction of an iron bridge across the Spey, below Kingussie, to replace the existing timber structure. The design prepared by Mr. A. Mackenzie, the district surveyor, shows a structure of three spans, each of 74 feet, with stone piers and neatly-chiselled pilasters. The piers are to be sunk on cast-iron cylinders, which will reach about 14 feet below the bed of the river.

AT the meeting of the Shropshire County Council forty-five applications were received for the post of divisional surveyor at a salary of 150*l.* Mr. J. Forster, Nottingham, was elected.

THE *Standard* says:—The most important portion of the great works at the Iron Gates, the cutting through the rocks of a navigable canal from the Servian to the Roumanian bank of the Danube, is reported to have been completed on Tuesday by the engineers of the Hungarian Government. The canal is 2,840 mètres long, 80 mètres wide and 3 mètres deep, thus allowing for the passage of medium-sized sea-going ships. The quantity of rock blasted was 360,000 cubic mètres. The water will not be let in before the rest of the works, of which this canal was the most difficult part, are finished.

THE managers of the Metropolitan Asylums Board have adopted plans for the erection of the Brook Hospital at Shooter's Hill, at an estimated cost of about 195,000*l.*

A "DAMNUM FATALE."

AN action was recently taken against the Caledonian Railway Company by Colonel Kidston and Mr. R. M'Clure, in which they claimed 3,000*l.* for damage to property in Glasgow. The plaintiffs are joint proprietors of houses in Stevenson Street and Tobago Street, Calton, Glasgow, which are occupied by tenants as shops and dwelling-houses. The railway company are constructing an underground railway from Dalmarnock to

SOLE AGENTS FOR GUITING STONE.

Maryhill, with branches, and diverted the main sewer. In connection with these operations they opened a trench along the edge of the footpath opposite the plaintiffs' property. On August 23, 1892, while the trench was open, there was a heavy fall of rain, which loosened the soil and caused a subsidence, the result being that the property was damaged. The loss, injury and damages they stated to be 3,000*l.*, made up of cost of removing the buildings in terms of order of the Dean of Guild Court, cost of re-erection, loss of rental, claims of damages at the instance of tenants, and expenses. The company denied that their operations for the construction of a sewer opposite the property were carried on in an unskilful and negligent manner, in consequence of which the pursuers' property was injured. They also pleaded *damnum fatale*. The case was tried before Lord Low, when the jury returned a unanimous verdict for the plaintiffs, and fixed the damages at 1,542*l.* 6*s.* 8*d.* The company applied for a new trial.

The Court granted the application.

Lord Low said his opinion was that the verdict was contrary to the evidence, and that opinion had been confirmed by the argument their lordships had heard. The company had adopted the best known method of carrying out a work of this sort, and although there was room for some difference of opinion as to whether some better method might not have been adopted, it was impossible to say that men of skill who honestly and after consideration employed it were guilty of negligence or want of reasonable skill. His lordship thought it proved that ordinary precautions were taken to guard against flooding by ordinary rainfall; but that the rainfall which occurred on August 23 was so exceptional and extraordinary that it was of the nature of a *damnum fatale*, which the defenders were not bound to guard against.

AN EDINBURGH FLOUR MILL.

ON Saturday, the 10th inst., the members of the Edinburgh Architectural Association paid a visit to the Chancelot Roller Flour Mill, Bonnington. The president of the Association (Mr. W. W. Robertson) referred to the death of the architect, Mr. James Simpson, who, it had been expected, would have conducted the party over the works, and introduced Mr. George Simpson, who was to conduct the company. Mr. Simpson explained that the extensive premises were being built not only for, but by, the Scottish Wholesale Co-operative Society, under their master of works, Mr. Davidson, the

Society employing the workmen direct and buying the materials, and making no contracts except in respect of the supply of machinery, ironwork and such like, and that the buildings had been brought very near completion within the short space of two years. The whole buildings were inspected, and the processes were explained by which the grain is converted into flour without the intervention of manual labour at a single point from the time when the grain is tipped out of the railway waggons to the time when the flour is stored in sacks in the warehouse. It was mentioned incidentally that by the new processes the danger of fire from the accidental ignition of the fine flour dust is obviated, as from first to last the flour at every stage is confined within the machines, shafts and elevators, and entirely prevented from coming in contact with the atmosphere of the apartments. Notwithstanding this the mill is fitted up with automatic sprinklers, especial attention being given to the tops of the elevators, where a temperature of 130 degrees brings them into action, causing a sudden down rush of a large volume of water. Before the visitors left the President expressed their thanks to the directors for their permission to visit the mill.

THE MOREAU-RAE MARBLE.

AT the invitation of the chairman and directors of the Marble (Moreau-Rae) Syndicate, Limited, a large number of architects and others were present on Wednesday, the 14th inst., at the works situated in Lots Road, King's Road, Chelsea, for the purpose of witnessing the interesting process whereby limestone is converted into marble in a very short space of time, and yet in accordance with nature's method. The demonstrations afforded were closely observed by those present, who were much impressed therewith, and the expressions of satisfaction were pretty general.

Any kind of limestone, we understand, forms a suitable basis for the process, although a soft stone is preferred for work of an ornamental character, such as is obtainable from the quarries of Poitou and Angoulême, while for plain slabs and columns a harder stone is preferred, especially a kind procurable from Marseilles, which contains a good deal of "shell" or flint, and is capable of being made to yield very fine results, but it is to be hoped that English stone will be largely employed.

The limestone selected to be operated upon is first of all

worked or carved into the required shape. It is then gently dipped in water, upon which varnish has been previously sprinkled, and so any variety of veinings are produced, and as the surface markings caused by the adherent varnish, which closely resemble those on ordinary marble, are impermeable, it follows that when the object is subsequently immersed in various baths of metallic solutions which penetrate the pores, excepting where the varnish adheres, a variety of patterns and shades of colour are induced as may be requisite. The stone takes up the solutions in the course of a few minutes, and then it is immersed in a bath of warm water, so as to become permeated to the centre with the colouring. After drying the object is placed in a bath of indurating solution, and the process is complete, so that what was simply limestone has become, to all intents and purposes, marble, only the metamorphosis, which nature requires ages to perform, is accomplished by the Moreau-Rae process in less than a week. The subsequent polishing is done in exactly the same manner as in the case of ordinary marble, while the cost of production is comparatively small, so that for decorative and other purposes there seems no reason why the Moreau-Rae marble should not be largely employed where the question of cost is paramount.

AUTOMATIC GAS AND WATER VALVE.

We have lately had the opportunity of inspecting at 51 Queen Victoria Street, E.C., a very ingenious and most useful appliance in the way of an automatic gas and water valve in connection with Maughan's patent geysers. This appliance is simplicity itself, and that perhaps accounts for no one having invented it earlier. The function of the appliance is to prevent any possibility of injury arising when the gas is alight and no water in the geyser. It acts under all circumstances, and is quite independent of all variations of pressure. The gas is shut off automatically immediately that the supply ceases, whatever the cause may be; the only condition under which the gas can be alight is absolutely that water must be flowing into the geyser. Any stoppage in the flow of water turns off the supply of gas. The principle, as before stated, is extremely simple, and so also is the construction; anything in the way of perishable material, complexity of arrangement is avoided, so that it cannot get out of order. It is certainly a great improvement on the previous interlocking gas and water taps which have been found so satisfactory. The Maughan's Patent Geyser Company,

Limited, have brought out several novelties, as may be seen from their last issued catalogue. One that is taking very well with the public is Maughan's patent geyser with improved mineral-oil burner, of which we give an illustration, for baths and domestic and general purposes, where gas cannot be obtained.

Another is a new geyser made of strong copper throughout. The gas check, which is now fitted to all the patent geysers, will be found a very great saving in time and trouble, in addition to securing the desired economy in consumption of gas.

JERRY BUILDING.

At the meeting of the Carlisle Architectural Association Mr. C. W. Hill gave an address entitled "The sins of the jerry builder and their effects on the public health." Mr. Hill commenced by defining the meaning of "jerry builder," and where and how he flourishes, and said his victims were, as a rule, the working man, who had saved enough money to buy a house of his own, and was led to believe that he was making a bargain by purchasing his dwelling from such a builder for a few pounds less than a proper house could really be built for. The lecturer pointed out many of the devices practised by the "jerry builder" to economise in the erection of a house, notably those of bad foundations, hollow walls filled in with earth or rubbish, hollow chimney-breasts causing smoky chimneys, no flashings to roof, wall plaster made of road sweepings, &c.; floors laid on the bare earth, and defective house drains, in which the ingenuity of the unscrupulous builder is seen to such advantage by the use of bad pipes and cheap fittings, &c. He emphasised the importance of efficient house drainage and plumbing to prevent the escape of sewer-gas, so conducive to illness, and said he was of opinion that not 10 per cent. of the drains laid up to ten years ago would now stand a proper test.

NATIONAL BUILDING TRADES EXHIBITION.

TO-DAY (Friday) is the opening day of a Building Trades Exhibition at the Royal Agricultural Hall, Islington, which may be expected to surpass anything of the kind hitherto witnessed as a Building Exhibition. A new series is thus inaugurated, under the management of Mr. W. R. Larkins. The list of names on the Consultative Council is, we may say, a guarantee of success, and that one of its objects, the development of business in connection with the building industries, will be secured. The following is the Council list so far:—Chas. Barry, F.S.A., F.R.I.B.A.; T. Chatfeild Clarke, F.R.I.B.A., &c.; Thos. De Courcy Meade, M.Inst.C.E.; Chas. Lynam, F.S.A., F.R.I.B.A.; J. Douglass Mathews, F.R.I.B.A., F.S.I.; Chas. J. Shoppee, F.R.I.B.A., President Surveyors' Institution; F. R. Farrow, F.R.I.B.A.; J. S. Phené, LL.D., F.S.A., F.G.S., F.R.I.B.A.; John Mowlem Burt (John Mowlem & Co.), Master of Loriners' Company; H. H. Bartlett (Perry & Co.), past President Institute of Builders; T. Freeman, F.G.S., F.S.S., Warden Shipwrights' Company; Lasenby Liberty (Liberty & Co.), Master of Glass Sellers' Company;

Owen A. Ellis (Ellis, Partridge & Co.); Thos. Minton, J.P. (Mintons, Limited); Edmund A. Pontifex, M.Inst.C.E., Master of Armourers' and Brasiers' Company; Pearse Morrison, Master of Blacksmiths' Company; Gilbert Wood, F.R.C.S. (Gilbert Wood & Co., 175 Strand); H. Greville Montgomery, "The British Clay Worker and Potter," 222 Strand, W.C.; Banister Fletcher, J.P., D.L., F.R.I.B.A.; Lewis H. Isaacs, F.R.I.B.A.; John E. Sears, F.R.I.B.A.; Tom F. Rider, Master of Tylers' and Bricklayers' Company; Lewis Angell, M.Inst.C.E., borough engineer, Stratford; Wm. Nisbet Blair, C.E., borough engineer and surveyor, St. Pancras. Hon. sec., T. Freeman, 202 Phoenix Street, N.W. Ingenious novelties and general attractiveness will no doubt contribute to draw all interested in building matters. One agreeable change in the arrangement of the exhibits is that they will now come under different sections, and visitors will see by a glance at the catalogue exactly where to find what they want to see. We notice the following prominent firms are represented:—The Coalbrookdale Company, Limited; Messrs. Yates, Heywood & Co.; the Shannon File Company, Limited; the St. Pancras Iron Company; the Carron Company, Limited; the Pickering Hoist Company; Messrs. Shanks & Co.; Messrs. F. Jones & Co.; the Incandescent Light Company, Limited; Mr. John Grundy; Messrs. Mintons, Limited; Messrs. Hayward Bros. & Eckstein; Messrs. Garstin & Son; Messrs. Humpherson & Co.; the Eagle Range Company; Messrs. Woollams & Co.; Messrs. Baird, Thompson & Co.; Messrs. Kirk & Dickenson; Mr. A. J. Angell; the Patent Victoria Stone Company, Limited; Messrs. Hartley & Sugden; the Fireproof Construction Company; Peace & Norquoy; the Paragon Bolt Company, Ltd., &c. These are the names only of a few of the exhibitors, and there can be no doubt that the exhibition will be of a thoroughly representative character. The promoters are endeavouring to revive the building trade, and have, as already mentioned, secured the patronage and active assistance of a council of the most eminent architects and supporters of the building industries. We trust that a liberal support will be given to this enterprise, which in every sense deserves success. We shall refer in detail in subsequent issues to all the most interesting exhibits.

Parkers, Limited.

This well-known firm in the Midlands have devoted themselves in a very exhaustive way to the construction of wood chimney-pieces which claim the special attention of architects, as each year shows a marked advance in artistic furniture, and makes

the study of chimneypieces of great importance to both architects and builders who have the arranging of this most important feature in the room. The introduction of wood mantels which can be coloured in harmony with any of the other portions of the furniture, in lieu of the cold and cheerless marbles, appeals to the eye of the architect and decorator, and from a commercial and economic view they are equally valuable.

The mill, which has lately been added to and greatly enlarged, is equipped with the most modern and effective machinery to be found in this branch of business, and enables

the firm to turn out at a very reasonable rate all kinds of finished woodwork, such as dados, doors, mantels and overmantels, and interior panelling and woodwork.

The wood used in the construction of the adjustable wood chimneypieces, which are protected by royal letters patent, and are a special and leading production of the firm, is of the very best quality, is fully matured and stacked for several years, and afterwards passed through their own patent drying stoves at a temperature of 125 deg. before use.

These chimneypieces will be on show at the Exhibition from March 16 to March 31, and we should recommend all interested in building and furnishing to go and inspect this important economic and indispensable patent.

The details of the construction of the adjustable chimneypieces are as follows, and which are found to be very simple, firm and effective:—

Separate jambs, as shown in a model, are formed with the frieze screwed at the special screws being used. The shelf is dovetailed into the top of the jambs and makes the chimneypiece substantial and firm, there being no mitres to give way, as all the mouldings on the frieze run at the back of the jambs. The sections on the face of the jambs are boxed and framed up. The mouldings are put horizontally on the vertical jambs and are returned in the solid and screwed from

the back. All the sections can be well and uniformly polished before being screwed together, and thus corners and recesses are equally finished as any other part. The most distinctive and advantageous feature in their construction lies in their being adjustable and interchangeable. Jambs, friezes and panels can be adapted at the pleasure of the architect or builder and changed in different rooms and to suit the special requirements of it, and the size of the chimneypiece can be enlarged or reduced as required by the space available to the extent of 5 or 6 inches, and marble slips or tiles can be introduced if desired, or to fit perfectly close to the grate.

These chimneypieces can be moved from one room to another without any dust or dirt and at a quarter the cost of

& Barton's patent), Cundy's patent, the "Century," the "Sabrina," and others, grilling stove, &c.; a collection of radiators, Heap's patent hydro-caloric and others, cast-iron baths, lavatory stands, &c.; a collection of Brosley tile goods of the well-known "Lighmoor" brand, made by patented machinery, also firebrick goods; a collection of electric-light fittings of various descriptions, in and out of use for the purpose of illumination, contributed by Mr. H. South, 10 Garrick Street, Covent Garden.

A. T. Angell.

Visitors should not miss seeing the exhibit of Mr. A. T. Angell. It is essential that a manhole shall be absolutely air-tight. Mr. A. T. Angell claims this special feature for his patent manhole cover, of which specimens may be seen at the exhibition. The illustration below shows how this advantage may be attained.

This cover, although removable, is locked and firmly fastened when closed.

Alfred Stevens, by Mr. R. Norman Shaw, R.A., Mr. Alfred Waterhouse, R.A., Mr. R. W. Lethaby, Mr. Faulkner Armitage, Mr. Basil Champneys, Mr. M. B. Adams, Mr. Scott-Morton, Colonel R. W. Edis, Mr. A. H. Mackmurdo, Messrs. Davis & Emmanuel, Mr. F. T. Pilkington, &c.; also Whitwell's patent ventilating grate, Parker's patent "Kyrle" grate for anthracite; a collection of gates and piers; railing for area and balcony, from designs by the late B. J. Talbert, by Mr. M. B. Adams, Mr. R. J. Haines, Mr. Lewis F. Day, &c.; a collection of staircase work, consisting of spiral staircase, lift enclosures in cast and wrought-iron, staircase railing, balusters, and newels in iron and bronze, from designs by Mr. F. T. Pilkington, Mr. B. J. Talbert, Mr. M. B. Adams, Messrs. Sulman & Hennings, Mr. J. J. Hibbett, Mr. R. J. Haines, &c.; a new adjustable fitting for balusters to handrail; a collection of kitchen ranges, comprising the "Circular" range (Richard

The flanges of the cover fall into specially prepared mastic composition, and are hermetically sealed. This arrangement is an effectual preventive of the escape of foul air, especially in hot weather, when the ordinary manhole cover becomes defective. Mr. A. T. Angell claims to be practically the originator of this improvement, and for twelve years his patent has met with great success. It is specified by the leading architects, and is to be found in the House of Commons, and the Board schools of London, Liverpool, and Manchester. Mr. A. T. Angell also exhibits Shoppee's patent non-slipping cover, the surface of which is corrugated, and admirably suited for heavy uses, stables, &c. Mr. Angell personally superintends the manufacture of every manhole cover sent out from his works, and will guarantee them absolutely air-tight. The visitor to the exhibition might with advantage give a call at the stand and see these points practically demonstrated.

REACTIONS OF CARBON IN BLAST FURNACES.

AT a recent meeting of the South Staffordshire Institute of Iron and Steel Works Managers, held in Dudley, Mr. W. J. Hudson, of the Woodside Ironworks, read a paper entitled "Carbon Reactions in the Blast Furnace." He stated that never was the need of a knowledge of carbon and its compounds in the iron-smelting furnaces more clearly demonstrated than at the period when Neilson introduced the use of heated air for smelting purposes. The heating of the air produced at the time such wonderful and inexplicable results that the various attempts to elucidate them proved unsatisfactory. Percy expressed the opinion that hot-blast was a lucky hit rather than an invention, as Neilson did not appear to have so much anticipated a saving of fuel in the hot-blast furnace as the removal of some minor troubles, such as chilling at the nose of the tuyères, &c. Had he anticipated a saving of fuel, he could not, in the then existing chemical and physical knowledge, have expected to save more—if even as much—than the amount he expended in heating the air. They could scarcely imagine the intense surprise of Neilson and his friends when they found a saving in the furnace so greatly in excess of their expenditure. Iron-smelters in those days were not chemists, nor for many years later was that science considered of much, if any, value to them. Hence, for many years the real explanation of the several actions and changes wrought by the aid of hot-blast was wanting. Nor did the subject of the chemical actions occurring in the blast furnace receive serious attention until after further economy had been realised by successive enlargements of the capacity of furnaces in the Cleveland district, which increased from 48 feet to 55 feet in height, with a capacity not exceeding 7,000 cubic feet, in 1851, to 106 feet in height and 33,000 cubic feet capacity, and one 90 feet high, with the enormous and never exceeded capacity of 42,500 cubic feet, in 1870 and 1871. The remarkable economy due to increased capacity set many minds to work, and about the year 1868 they first began to realise the immense value of chemical and physical knowledge to the iron-smelter. Since that year they had been taught the major portion of what they now knew of the many intricate actions and reactions which go to make up the science of iron-smelting. Even now there was much to learn and much to settle. There were many divergencies of opinion as to how certain actions and reactions were brought about, and the ultimate effect or result of such reactions upon the economy and productive

power of the blast furnaces. Broadly speaking, heating of the air and the enlargement of the cubic capacity of furnaces had the effect of reducing the quantity of coke or carbon necessary to make a ton of pig-iron, by altering the conditions in the upper regions of the furnace in such a manner that the iron ore was enabled to undergo a much longer period of exposure to the action of carbon monoxide at a lower temperature than existed either in a furnace of small dimensions or in one blown with cold air. The keynote of economic smelting was to deoxidise the ore by means of carbon monoxide at a temperature too low to permit of any of the carbon dioxide then formed being reduced again to the lower oxide. In concluding the paper, in which technicalities were mostly dealt with, the writer observed that it was evidently of the highest importance to secure complete calcination of the ores when they were of the carbonate variety, such as Cleveland ore or the native mine of South Staffordshire. For every unit of carbon (of dioxide) remaining unremoved from the ore another unit of carbon might have to be removed from the fuel, thereby increasing a preventable waste.

Mr. C. R. Wright pointed out that in all probability the deposition of carbon was closely connected with the temporary formation of some form of carbonyl, which partly breaks up into oxide of iron and free carbon at certain temperatures. This, however, was little more than a speculation, without any very definite proofs. Mr. T. Roberts, the chairman, said that, according to the remarks of Sir Lothian Bell in a recent paper he had written, the size of furnace giving the best results was about 11,500 cubic feet. That furnaces of medium cubic capacity were capable, under certain conditions, of producing equally as efficient results as those of much larger capacity was amply proved by the fact that in America furnaces of 25,000 cubic feet were made to produce as much as 3,000 tons of iron per week; whilst in Cleveland, where the cubic capacity of the furnaces was as much as 33,000 feet, the average yield was only about 800 tons per week. In addition, the fuel consumption in America was about 3 cwt. less per ton of iron, as compared with Cleveland. Of course, the difference in the quality of the ore obtainable in the two countries accounted in a great measure for this disparity, but not altogether, as was shown by the fact that the Dowlais Iron Company, of Cardiff, could produce better results with the same economy of fuel, with a furnace of 25,000 cubic feet capacity, than was obtained in Cleveland with furnaces of 30,000 cubic feet. It appeared to him that the manufacturers of the Middlesbrough district,

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

B. WARD & CO.,

15 GREAT GEORGE STREET, S.W.

CONCRETE STAIRCASES.

Of GERRARD STREET, BIRMINGHAM.

Is the Inventor and Sole Manufacturer of the Genuine

Adamantine Shell Plaster, for Walls, Ceilings, &c.

Thirteen years in use without a single failure. Testimonials, particulars and samples free.

GENERAL STONE MERCHANTS.

Every description of Stone and Granite

kept in stock, including Bath, Portland, York, Red Sandstones,

Stantonford Sandstone, Hopton Wood,

Pennant, Painswick, Forest of Dean

Alabaster.

Also every description of Granite

and British Marbles. Every

attention given to Architects' specifications as to colour and durability.

READING CASES FOR THE ARCHITECT.

Price Two Shillings.

OFFICE, 175 STRAND, LONDON, W.C.

much as they prided themselves on being foremost in the iron and steel making industries, were too much wrapped up in formulas and scientific attainments, and did not pay sufficient attention to acquiring that practical knowledge which would enable them to get the most economical driving out of their furnaces.

STRAND IMPROVEMENTS.

THE highways committee of the London County Council have drawn up a report with reference to the widening of the Strand and Wellington Street, in which they state that they have ascertained that the property required for setting back the western side of Wellington Street to the line of Lancaster Place, and for rounding the corner at the junction with the Strand, is the freehold of the Duchy of Lancaster, and that most of the leases will fall in at Christmas, 1896. By adding the land to the public way the width of Wellington Street between the Strand and Lancaster Place would be increased to about 100 feet, and the Strand between Wellington Street and Savoy Street would be at least 80 feet wide. The price asked by the Duchy is 32,000*l.* The estimated cost of the paving works is 2,700*l.* Having regard to the very favourable opportunity now presented for effecting this much-needed improvement at the least possible cost, the committee recommend the Council to accept the terms of the Duchy of Lancaster and carry out the improvements suggested.

SOCIETIES' SECURITIES.

A PAPER on "Building Societies and their Securities" was read by Mr. J. Lindsey Johnson before the members of the Auctioneers' Institute, at their rooms, 57 Chancery Lane, last week. Mr. G. Brinsley, president, occupied the chair. Mr. Johnson said he was against embarking the money of poor people in large undertakings, such as the residential flats that were becoming so popular. The fashion might change, and when the residential flats were empty to any extent the so-called securities would be worth nothing. It was, however, entirely different with freehold houses, land and good leasehold securities, where the ground-rent was five and six times covered by the rack-rent, because if these were held as securities for two-thirds of the selling value after the usual and necessary deductions, no society could go far wrong. He

contended that the directors of a property company ought not to advance upon or purchase the leasehold interest, except at a knock-down price, in a property where the ground-rent was only one and a half or twice covered. He drew three lessons from the events of the past eighteen months. First, no society that lent money upon securities as second or third charges was doing safe business; secondly, no balance-sheet should be deemed satisfactory unless audited by an independent firm of accountants, and directors should make affidavit that they had closely examined all the deeds relating to mortgages and securities; and, lastly, the position of directors and their ability for the due performance of their duties needed much more attention from investors.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 4068. Albert Cope, for "Improvements in or relating to sash windows."
- 4084. Johann Franz, for "Improvements in spring or weight-actuated blowers or ventilators."
- 4107. George Maule Marchant, for "Improvements in safety-valves for domestic boilers."
- 4173. William Cook, for "Improvements in ventilating-shafts for sewers and for other purposes."
- 4175. Cornelius Birkery & Hubert K. Wood, for "Improvements in ball-cocks."
- 4187. Douglass Commerell Menzies Fitzmaurice, for "Improvements in taps."
- 4192. Harvey Hallock Burritt, for "Improvements in valves."
- 4205. William Anderson, for "A valve."
- 4377. Robert Astley, for "Improvements in the construction of fireproof floors."

THE Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

COMPETITIONS OPEN.

COCKINGTON.—May 1.—Plans are invited for New Church. Rev. T. S. Rundle, Cockington, Torquay.

GILLINGHAM.—April 6.—Alternative Designs are invited for a School in Three Departments. Mr. E. T. Atchison, Local Board Offices, Gillingham, Kent.

GOOLE.—April 16.—Competitive Designs invited for a Covered Market, with Shops fronting Boothferry Road and Estcourt Terrace, with a Board-room, necessary Clerks', Surveyors', Inspectors', Collectors', Gas and Water and other Offices, with the Necessary Anterooms, Storerooms and Lavatories, to be Erected upon the Land and Premises, in Goole, abutting upon the before-mentioned Streets. Mr. George England, Local Board Offices, The Exchange, Goole.

LANCASTER.—May 1.—Competitive Drawings invited for Extension of Markets, and Erection of a New Hotel. Mr. John Cook, A.M.I.C.E., Town Hall, Lancaster.

LLANDUDNO.—May 31.—Designs are invited for Municipal Buildings. Mr. E. P. Stephenson, A.M.I.C.E., Llandudno.

LONDONDERRY.—May 1.—Plans are invited for proposed Baths and Washhouses. Mr. Robert N. Chambers, Guildhall, Londonderry.

ROTHERHAM.—March 25.—Schemes are invited for dealing with the Disposal of Sewage for the Borough. Premiums of 150l. and 50l., premium to merge. Mr. H. H. Hicknott, Town Clerk.

CONTRACTS OPEN.

ABERGAVENNY.—March 29.—For Building Stabling, Cartsheds, Workshop and other Works. Mr. J. Haigh, Town Surveyor, Abergavenny.

BANSTEAD.—March 29.—For Erection of a Band-room at the Public Schools. Messrs. A. & C. Harston, 15 Leadenhall Street, E.C.

BECCLES.—March 31.—For Erection of a Tank for Gas-holder and Retort House, and a Building for the Governor. Mr. C. F. Parker, Gas and Water Company, Beccles.

BELFAST.—March 23.—For Alterations, Imperial Hotel. Messrs. Young & Mackenzie, Architects, Donegall Square East, Belfast.

BOTTOM, DORSET.—March 27.—For Erection of Five Dwelling-houses. Office of Works Department, 21 Craven Street.

BRIGHTON.—March 29.—For Constructing a Concrete Groyne, Storm-water Outlet, and an Overflow Chamber on the Beach, opposite Western Street; for Constructing a Storm-water Outlet and Making Additions to the Existing Groyne on the Beach opposite the Old Steine; for Constructing about 980 Yards of Brick Sewers, 8 Feet in Diameter, 562 Yards of Brick Sewers of Smaller Dimensions, and certain Pipe Sewers. Mr. Francis J. C. May, C.E., Town Hall, Brighton.

BURNLEY.—March 27.—For Building Three Police Stations The Borough Surveyor.

BURTON-ON-TRENT.—April 5.—For Building Infectious Diseases Hospital. The Borough Surveyor.

VERITY BROS. CALL LANE, LEEDS.

Manufacturers of their High-Class

ROLLING BOLT, MORTICE & RIM LOCKS, NIGHT LATCHES, &c.

In our Deadweight Lock as per drawing herewith, we have so applied the different Movements that the pressure is equal in both ways of turning the knob, and we guarantee their giving entire satisfaction.

We are also Manufacturers of—

The largest Varieties of Openers suitable for Skylights, Fanlights, &c., which can be fixed in any position.

Casements in Wrought Iron, Steel, and Gun Metal.

Espagnolette Bolts, Weather Bars, Sash Fasteners, Door Checks.

CATALOGUES FREE BY POST.

CARDIFF.—April 11.—For Building Head Post Office. The Secretary, H. M. Office of Works, 12 Whitehall Place, S.W.

CHESHUNT.—March 26.—For Construction of about 3,200 Yards of Sewers. Mr. Samuel Towlson, Turner's Hill, Cheshunt.

CROYDON.—April 3.—For Supply of 13,000 Feet of Norway Granite Kerb and 100 Tons of Norway Granite Setts. Mr. W. Powell, 8 Catherine Street, Croydon.

DERBY.—March 29.—For Building County Council Offices. The County Surveyor.

ESHER.—April 4.—For Erection of Five Cottages and Building Additions to the Sewerage Works. Mr. James Edgell, Gate House, Portsmouth Road, Kingston-on-Thames.

GLASTONBURY.—March 30.—For Erection of Police Buildings. The County Surveyor, 1 Belmont, Bath.

HAVERIGG.—March 24.—For Building Parsonage. Mr. A. E. Bradley, 15 Horn Hill, Millom.

HENDON.—April 2.—For Construction of about 940 Yards of Tar Pavement, with Kerb, &c., at Redhill, Edgware. Mr. F. J. Seabrook, Edgware.

ISLINGTON.—April 2.—For Paving with Creosoted Deal Blocks a portion of Holloway Road, and Paving a portion of Grove Road with Granite Setts removed from Holloway Road. Mr. W. F. Dewey, Vestry Offices, Upper Street, N.

KETTERING.—March 24.—For Building Board School. Messrs. Gotch & Saunders, Architects, George Street, Kettering.

LEICESTER.—April 3.—For Preparing the Site, the Construction of a Concrete, Puddle and Earthen Dam or Embankment for a Storage Reservoir to contain about 500,000,000 Gallons and for Road Diversions, the Tunnel Outlet and Valve Tower and Valve House in connection with the Swithland Reservoir. Mr. J. Beverard, M.I.C.E., 6 Millstone Lane, Leicester.

LINTHWAITE.—March 27.—For Alterations to Church. Mr. C. Hodgson Fowler, Architect, The College, Durham.

LUDGVAN, CORNWALL.—March 26.—For Rebuilding and Alterations at and Additions to Commercial Hotel. Mr. J. W. Trounson, F.R.I.B.A., F.S.I., Architect, Penzance.

MALMESBURY.—March 24.—For Construction of Brick Gasholder Tank. Mr. James A. Jones, Malmesbury.

MANCHESTER.—April 4.—For Building Inland Revenue Office. H.M. Office of Works, 12 Whitehall Place, S.W.

MIDDLESEX.—March 26.—For Supply of 3,000 Cubic Yards of Hand-broken Granite. Mr. F. H. Pownall, Guildhall, Westminster.

MILE END.—March 28.—For Erection of a Mortuary. Mr. William Jutsum, Vestry Hall, Bancroft Road, E.

MILLBROOK.—April 2.—For Building Board School, House, &c. Mr. A. F. Gutteridge, Architect, 9 Portland Street, Southampton.

MORLEY.—March 29.—For Building Shop and Eight Houses. Mr. G. B. Clegg, Architect, Morley.

NEATH.—April 2.—For Alterations to Board School. Mr. T. C. Wakeling, Architect, Merthyr.

NOTTING HILL.—March 28.—For Painting, Colouring and Cleansing Works, Repairs and Alterations at the Parish Infirmary. Mr. E. J. Rossiter, Guardians' Offices, Northumberland Street, Marylebone Road, W.

RAMSGATE HARBOUR.—March 31.—For Erection of a Wooden Landing-stage at East Pier Head. Mr. C. Cecil Trevor, Board of Trade and Harbour Department.

ROMFORD.—March 28.—For Reparation of Church Tower. Mr. Fred. Chancellor, Chelmsford.

ROMFORD.—March 31.—For Supplying, Laying and Fixing Paving, Kerbing and Channelling in the Romford Market, and for Supplying, Laying and Fixing Paving and Kerbing in various Roads in the District. Mr. George Bailey, Romford.

ROMNEY MARSH.—March 30.—For Supply of 3,000 Yards of Rock for Dymchurch Sea Wall. Mr. Edward Case, New Hall, Dymchurch, Kent.

SHEFFIELD.—March 31.—For Excavation and Construction of Concrete and Brick Foundations for Proposed New Buildings, Liquor Tank, &c., at the Grimesthorpe Station of Sheffield Gas Light Company. Mr. Hanbury Thomas, Commercial Street, Sheffield.

SHEFFIELD.—March 31.—For Erection of a Boiler-house at the Neepsend Station of Sheffield Gas Light Company. Mr. Hanbury Thomas, Commercial Street, Sheffield.

SOUTHAMPTON.—March 29.—For Building Engineering Laboratory. The Borough Engineer.

ST. JUST, CORNWALL.—March 23.—For Alterations and Additions to Pendeen Board Schools. Mr. J. W. Trounson, F.R.I.B.A., F.S.I., Architect, Penzance.

TORQUAY.—March 27.—For Extension of the Existing Fish Quay by the Erection of about 300 Lineal Feet of Con-

The largest and best variety of Fanlights and Sash Openers, &c. to suit all requirements, viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES.—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c., &c.

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent.

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

No. 209. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

crete Walling, Filling behind Same and Paving Deck with Portland Cement Concrete; the Erection on the afore-mentioned Quay of Offices and Coal and Fish Stores, &c., having a total Superficial Area of about 20,000 Feet. Mr. Henry A. Garrett, Town Hall, Torquay.

TOTTENHAM.—March 27.—For Supply of 500 Yards of Asphalte Paving. Mr. P. E. Murphy, Coombes Croft House, Tottenham.

TOTTENHAM.—March 27.—For Making-up Sutherland Road, Ida Road, Hartington Road, Roslyn Road, Burlington Road, Kemble Road, Etherley Road (part of), Eckington Road, Hampden Road (remainder). Mr. P. E. Murphy, 712 High Road, Tottenham.

TOTTENHAM.—March 27.—For the Supply and Delivery on the Works of about 1,150 Tons of 16-inch Cast-Iron Water Main, with all Necessary Bends, Valves, &c. Mr. P. E. Murphy, 712 High Road, Tottenham.

TOXTETH PARK.—March 27.—For Building Refuse Destructor Works. Mr. John Price, Engineer, Public Offices, Lark Lane, Toxteth Park.

WAR OFFICE.—April 1.—For Triennial Contracts for Repairs and Materials at the various District and Sub-District Stations. Mr. G. Lawson, War Office, Pall Mall.

WINCHESTER.—March 28.—For Construction of Bridges (Steel and Brickwork) over Canal. Mr. James Robinson, Engineer, 13 Southgate, Winchester.

WREXHAM.—March 31.—For Laying Down about 10,000 Yards of Tar or Asphalte Paving. Mr. J. W. M. Smith, Borough Surveyor.

HALLIDAY'S CLAPTON LIGHTS.

Simple, Powerful, Economical. Reflection and no Complication.

OPEN TOP, AS SHOWN, OR VENTILATING. PLAIN OR ORNAMENTAL.

Much used in Places of Worship, Lecture Halls, Board Schools, Shops, Large Offices, Markets, &c.

Suitable for wherever a Very Powerful, Well Diffused, Soft, Economical, and

Easily Managed Gas Light is desirable. Made in Five Sizes.

HONoured WITH SUNDRY IMITATIONS.

Seven years from Invention up to April 1890 over 11,300 sent out. But

Up to the end of 1893, over 23,000 sent out.

A PERPLEXED GAS INSPECTOR.

"There has been so great a reduction in our consumption of gas at Speke Hall, Battersea, since we had your CLAPTON LIGHTS, that the Gas Company declared our meter must be out of order. They have had it examined, and can find nothing wrong.

R. H., London, September, 1893."

The Gas Light also at this Hall is said to be over twice what it was before.

VARIETIES.

MESSRS. CROSBY LOCKWOOD & SON have issued their Price-book for this year. It forms a portly volume owing to the detailed character of the information. Especial attention has been given to the section relating to electric lighting. The new sanitary by-laws of the London County Council are given in full. Every year additional pains are taken to satisfy the requirements of the legion of supporters of "Lockwood." There are few who will not agree with the editor when he says:—"Building operations grow dearer year by year, without any corresponding benefit to any persons engaged therein; for it cannot be pretended that the workman is any gainer by the periodical strikes, even where these are successful, when the money lost by him during his enforced idleness while they are in operation is taken into account."

A SITE of five acres has been purchased at Clacton by the authorities of the Middlesex Hospital, with a view to the erection of a convalescent home. The home is to accommodate forty-five convalescents.

MR. RITCHIE, the manager of the Royal Aquarium, will present next week an astonishing variety of performances. There will be at least seventy "turns," a number that is unprecedented in stage history.

THE late Mr. Henry Boys, a leading brick manufacturer of Walsall, who died on Friday, leaving an estate of 100,000*l.*, has bequeathed nearly 20,000*l.* to charities. The Wolverhampton Orphan Asylum receives 7,500*l.*; some almshouses at Walsall, which Mr. Boys established, 4,000*l.*; Walsall Cottage Hospital, 2,000*l.*, &c. 3,500*l.* are to be invested for annual distribution of blankets and boots, and 1,000*l.* for a free Surgical Appliances Fund.

THE directors of the Glasgow and South-Western and Ci Union Railways are contemplating an extension of their line

CHARLES D. PHILLIPS,
NEWPORT, MON.

in the city, involving the widening of the bridge which crosses the Clyde between the Stockwell and Albert Bridges. A sum of 100,000*l.* is mentioned as the estimated cost of the proposed works.

THE lords, bailiffs and jurats of Romney Marsh have further considered the report of Mr. Wolfe Barry and Mr. Matthews with regard to the Romney sea wall, the works recommended to make good the damage recently caused and to defend the marsh from inundation in future being estimated to cost 41,000*l.* Finally it was resolved to reconstruct that portion of the wall which has been practically destroyed on its seaward side on the old principle of a long sloping apron 180 feet wide at the base, constructed of rock paving bedded in concrete and pointed in cement; further, that thirteen groynes, running out from the wall to low-water mark, should be constructed at suitable distances.

A NEW turret Cambridge-quarter clock has this week been erected in St. Mary's parish church, showing the time on two large copper dials, by Messrs. Wm. Potts & Sons, clock manufacturers, Leeds, from instructions received from Mr. Wensley Hunton, solicitor, who is acting for the donor, Mrs. S. Bones, of Richmond.

THE Edinburgh Town Council have resolved to withhold their consent to the buildings in Princes Street between the Waverley steps and the North Bridge being raised to more than 60 feet in height above the level of the street, unless the railway company propose to take down the present buildings and rebuild them within five years from this date, according to a design to be approved by the corporation; and in the event of such a proposal being made, the matter to be again brought before the council for decision as to what increase in height, if any, shall be allowed and on what conditions.

BUILDING AND BUILDERS.

THE Halifax School Board have decided to borrow 7,500*l.* for the enlargement and furnishing of the higher school, and also to enlarge the Siddal school according to plans by Messrs. Horsfall & Williams.

THE London County Council have agreed to rebuild Lea Bridge at an estimated cost of 10,000*l.*, on condition that the Essex County Council contribute 4,250*l.*, the Lea Conservancy Board 500*l.*, and the Leyton and Walthamstow Tramways Company 1,000*l.* towards the cost.

INFANT schools, in connection with St. Lawrence's parish church, Longridge, near Preston, are to be erected as a memorial of the late Rev. F. A. Cave-Browne Cave, many years vicar of the parish.

THE EMPRESS FREDERICK AND PLUMBERS' WORK.

THE Empress Frederick, on the occasion of a lengthened visit last week to the plumbers' workshops at the Shoreditch Municipal Technical Schools, equipped by the Plumbers' Company, evinced much interest in the work of the plumbers' apprentices, and expressed her strong sense of the importance of securing sound workmanship in connection with plumbing arrangements.

The details of the students' work which was being executed during Her Majesty's visit were pointed out to the royal visitor by Mr. Quelch, operative plumber and sanitary inspector to the Shoreditch vestry, who is the teacher of the classes. Specimens of lead-work executed by operative plumbers in various parts of the kingdom were shown and their merits pointed out by Mr. G. B. Dav's, foreman plumber to Messrs. Jennings. Her Majesty asked many questions as to technical details, and seemed to quite understand the purpose for which the various appliances and pieces of work were intended.

Her Majesty seemed especially interested in the work of a little lad who was wiping a joint, and she was much surprised to learn the small charge made for instruction in plumbing. It was pointed out that the cost to the plumbing pupils was equal to 1*d.* per lesson of 2½ hours' duration, including the cost of material.

Mr. Philip Wilkinson, F.R.I.B.A., renter warden to the Plumbers' Company, explained the educational system for plumbers which is being carried out in various centres throughout the United Kingdom. Her Majesty inquired whether the plumbers were given instruction in the principles of hygiene, in order that they might be made acquainted with the serious consequences which would result to the public health from defects in plumbers' work. Mr. Wilkinson stated that the requisite instruction in hygiene is given in the plumbers' classes at King's College and elsewhere. Her Majesty desired to be informed of the future progress of the educational system.

PROGRESS IN CANADA.

WE have received from Sir Charles Tupper, Bart., High Commissioner for Canada, an advance copy of Part I. of the reports of the Tenant Farmers' Delegation which visited Canada during the autumn of 1893. It refers to the visits of English agricultural experts to Canada, and should prove of interest to those engaged in agricultural pursuits. The reports given are those by Messrs. R. Shelton, Nottingham; B. Waddington, Chesterfield; J. Cook, Cleobury Mortimer; and J. Smith, Sowerby. The reports, however, are interesting to others besides agriculturists, for the authors have enlivened the technical information by many remarks on what they have noticed *en route* as to buildings, scenery and municipal arrangements in the cities and towns passed through. One thing that will strike the reader is, that while in this country we are tentatively using electricity for lighting and motive purposes, the Canadians have been employing it for all purposes. In Mr. Shelton's report, for instance, occur the following remarks:—

Darkness setting in shortly after our arrival at Quebec, and a severe thunderstorm raging at the time, we were reluctantly compelled to abandon our intention of taking a run round the city, especially as the vessel lay to on the opposite side of the river, at Port Levis. The whole outlook after daybreak the following morning, as we continued our course up the beautiful St. Lawrence river, was one of such exquisite beauty as I have never before witnessed, and far beyond my abilities to describe. To travel on board ship right through the estuary of the St. Lawrence and then up the river in such beautiful weather as we were then enjoying, and to behold the varied and attractive scenery which everywhere presented itself from either shore, I felt was enough to repay one for any expense or inconvenience necessarily consequent upon leaving home and business for a rather long period. The river smooth as glass; the air, though hot, yet fresh, clear and exhilarating; the ship riding so steadily as to make it difficult to tell she was moving; here hills sloping to the river, covered, or partially so, with young trees of various hues; next a flat of cultivated land, principally consisting of corn crops, some cut and in stook, and some awaiting its turn to be similarly treated; with here and there dotted about at intervals, varying from a few yards to a few hundreds, neat-looking cottages built of wood, and with coverings of almost endless variety, showing unmistakably that the occupations are generally very small, owned and occupied, I was told, principally

by French Canadians; then a quaint little village would come into view, with its dwellings of greater or less pretensions, and with its pretty church—all contributing their quota to the apparently almost endless scene of exquisite beauty.

The good ship landed us at Montreal about 1.30 P.M. on Saturday, August 26. Montreal has a population of about a quarter of a million, 64 per cent. being of French extraction. No expense has been spared to make the city attractive. It is lighted by electricity, and has a very complete service of tram-cars, which are driven by electricity, about fifty miles of lines being already in use. The public buildings are on a scale not often excelled, and there are about 140 churches of all denominations, as well as a Roman Catholic cathedral, which, it is said, has had four million dollars expended upon it, and is now awaiting completion for want of funds. Roman Catholics and Presbyterians take the lead, and apparently vie with each other as to the size and splendour of their edifices, though the Church of England has a splendid cathedral.

We left Montreal on Monday, August 28, for Ottawa, the capital of the dominion, which has a population of close upon 50,000, and is rather picturesquely situated at the junction of the Rideau and Ottawa rivers. There are numerous fine residences, hotels, &c., all of which are overshadowed by the stately Houses of Parliament and other Government buildings. There is here, also, a very full service of tramcars, which, like Montreal, are driven—as well as the streets and the more important buildings being illuminated—by electricity. The principal industry of the city appears to be the lumber trade, although there are a number of other industries, such as paper manufactories, match manufactories, &c., several of which we visited with much interest. Vast quantities of logs are floated down the Ottawa river and its tributaries, and are here sawn into lumber, a term which in Canada seems to be applied to all kinds of converted timber.

Leaving Ottawa on the morning of August 30 we travelled by Canadian Pacific Railway to Winnipeg, the journey occupying 52½ hours, the distance being 1,304 miles. The scenery at times was very charming, many places of note being passed. Lake Superior, winding in and out round numerous little islands, is a most effective spectacle, extending for many miles, now in, now out of view from the train. Still, the outlook for some hundreds of miles was extremely monotonous—one vast forest, rugged and undulating, chiefly of fir trees. The timber had the appearance of lacking a sufficiency of suitable substance for healthy growth upon the rocky foundation which every-

"SPHINX" PORTLAND CEMENT.

119 lbs. per bushel. Slow setting; test 1,000 lbs. to 14 inch; seven days. Fineness, 2,500 meshes to square inch, with less than 10 per cent. residue. Over 10,000 tons supplied to Cardiff and Hereford Water Works.

where prevails. Here and there might be seen stretches of forest destroyed by fire, little more than the charred stumps of trees remaining.

On reaching Winnipeg we were met by Mr. G. J. Cox, a gentleman who had been deputed to act as guide to our contingent of delegates throughout our tour through the provinces and territories of the North-West. We were driven to the Manitoba Hotel. Although the population does not exceed 30,000, this edifice is eight storeys high, and has over 700 bedrooms. In the principal streets of the city there are numerous fine buildings, while the main thoroughfares are 132 feet wide, and have four sets of tram lines, the cars upon two of which are driven by electricity and two by horse-power.

As we approached the "Rockies" an observation car was attached to the train—that is, a large car open along both sides, specially designed to allow an unbroken view of the wonderful mountain scenery. To attempt to describe this scenery would, I feel, be nothing less than presumption on my part. These mountains reached about 500 miles either side of us on our journey, many of them of such dimensions and of such an altitude as to fairly strike one with feelings of awe as well as admiration and amazement. Many of the higher ones had their summits enveloped in the clouds, while others of still greater altitude peered right through the clouds, and in the distance—with their rugged tops thickly capped with snow, which a summer's sunshine and heat had been powerless to remove—looked like huge icebergs. The train for some hundreds of miles wound its way by the course of a river or rivers, running nearly always on the base of the mountains, sometimes only a few feet, and sometimes a great many feet above the edge of the water, and often made such sudden and sharp turns as to make its progress appear decidedly unsafe, although at such times it was driven very steadily. It is said that in passing through these mountains "the railway leads at different and many times towards every one of the thirty-two points of the compass."

As we emerged from this glorious mountain district and approached Vancouver, it was at once noticeable that we were in a country of a different climate; the apple, pear and plum trees, the thorn, and the herbage in the fresh-looking pastures—all conspicuous by their absence in Manitoba and the Territories—at once proclaiming the fact. The climate of British Columbia is said to resemble that of England, but with a greater average rainfall. We reached Vancouver on Saturday evening, September 30, the journey from Regina having taken

a little over forty-eight hours, the distance being 1,125 miles. Although this city was, with the exception of one solitary house, totally destroyed by fire so recently as 1886, it is now about the best built and prettiest place we visited, with a population of about 18,000. It fronts on Coal Harbour, a widening of Burrard Inlet, and extends across a strip of land to English Bay, along the shore of which it is now reaching out. Streets are wide, and the principal ones asphalted. It is lighted by electricity, and has its service of electric trams.

Of Vancouver Mr. Waddington says:—Previous to 1886 a dense forest covered the ground now occupied by the city of Vancouver (population, 20,000), well situated on Burrard Inlet. It has a splendid harbour of deep water. There is a line of steamships running from here to China and Japan, also to San Francisco and other Pacific ports; and as the terminus of the Canadian Pacific Railway, Vancouver must become a large and important city. Around it are immense forests of splendid timber, rich minerals in variety and rivers teeming with fish. The city presents a straggling, unfinished appearance, but there are many good buildings—hotels, banks, churches, &c.—of granite and brick, and one can hardly realise that all have been built in seven years.

Of Montreal Mr. Joseph Smith says:—We arrived about two o'clock on Saturday afternoon, August 26, and went to the St. Lawrence Hall Hotel, where we stayed over Sunday. The same afternoon we went into the town and saw what could be seen of its buildings. The streets are well laid out, with boulevards and squares, large, substantially stone-built public buildings and offices for the business part of the town. It is a city of electricity; everything goes by it—the telegraph, trams, street lamps, and nearly all the houses and shops are lit by it. The telephone is everywhere, and is very convenient. You can order from your butcher or baker the day's provisions without going out of your own house. The churches are on a grand scale.

Of Winnipeg he says:—Evidently the inhabitants have great faith in the future of their city, for the buildings generally and appointments are far in excess of its present requirements. The streets are very wide and pleasantly laid out; the electric car, telephone and electric light are in general use, and there is no crowding, as is the case in too many of our large towns. The growth of the place is astonishing, for when General Wolseley led his force in 1870 from Fort William to Fort Garry (as it then was called), there were only about one hundred inhabitants; now there are nearly thirty thousand.

NOTES ON NOVELTIES.

The "Row" Calorifier, with Royle's Patent Automatic Steam Attachment.—An apparatus for heating water for

baths, lavatories and all purposes where an abundant supply of water heated by steam is required. The "Row" Calorifier appears to be more efficient and occupies less space than any other system. The automatic attachment is a most important addition to this kind of apparatus, controlling the steam automatically so as to keep a uniform temperature in the water. The "Row" Calorifier is an application of the "Row" heating section arranged in a suitable casing. Steam is sent through the sections or tubes, and water is circulated around them. The water thus takes up the heat from the steam. The illustration shows a No. 4 Calorifier arranged for heating water by means of steam for circulating round a building, for which purpose it is provided with flow and return sockets cast to the body A (in the larger sizes we advise flange connections), in which are fitted the "Row" heating sections or tubes, and the action of these tubes in heating and circulating the water is exactly the same as an ordinary boiler, except that the heating medium is steam instead of fire heat. The automatic attachment consists of a steam valve B, controlled by a tension bar C. This bar is rigidly attached to the calorifier body at its ends, and having a slight amount of bow in it (like a bowstring on the stretch), is extremely sensitive to any variation in the length of the calorifier arising from change of temperature. Alteration in temperature causes the bow to move the regulating valve B nearer to or further from its seating, and thus control the steam supply automatically, maintaining an even temperature in the circulating water. The temperature can be varied by altering the adjustment at D. The condensed water is discharged at G, and a suitable trap should be fixed at this point, or under favourable conditions the water may be led back direct to boiler. The "Row" heating section referred to above consists of a copper tube indented in a peculiar manner, as shown in the illustration. It is found that a tube flattened or indented in this way has double the efficiency for heating purposes over a plain tube, and the reason why this apparatus is more compact and efficient than heaters with plain tubes or coils is thus apparent. Moreover, the indentations render the tube elastic, so that fracture at the ends, so common in coil and other heaters, is impossible.

INSTITUTION OF CIVIL ENGINEERS.

At the last meeting, Mr. Alfred Giles, president, in the chair, a paper was read dealing with "The Prevention and Detection of Waste of Water," by Mr. Ernest Collins.

Waste of water comprised—(1) visible waste above ground, caused by defective mains or pipes, or by unsound and unsuitable house-fittings; (2) hidden waste, arising from broken pipes underground, or from faulty mains or services, where the water escaped unperceived and found its way into sewers or disused drains, also that arising from secret overflows from baths, cisterns, underground tanks, gas-engine coolers, &c.; (3) wilful waste caused by leaving taps open and tampering with fittings; (4) undue consumption of water, which, although used wastefully, was serving some useful purpose. The first two kinds of waste could be dealt with by systematic inspection, constant supervision and the employment of suitable appliances. Wilful waste was difficult to discover, whilst it was still more difficult to find the offender, and it was most difficult to obtain a conviction of the offender when found. Undue consumption was difficult to define. What some might hold to be unnecessary consumption, others would consider a legitimate use of water.

Among fittings which caused undue consumption, the automatic flushing-tank was a very objectionable form of apparatus. Another frequent cause of undue consumption was the faulty design of closet-pans, which should be so constructed that the jet of water might act on the soil to be displaced in the direction of the outlet. Where this was carried out the regulation allowance of two gallons at each flush would suffice.

Hydraulic motors, lifts and elevators, when worked off comparatively low-pressure mains suitable for ordinary domestic or trade supply, occasioned undue consumption. Ornamental fountains and careless garden-watering also gave rise to undue consumption and, in some cases, wilful waste. One of the chief means of preventing waste was the introduction of thoroughly efficient fittings into the houses of consumers. The regulations made with the approval of the Board of Trade, under the Metropolis Water Act of 1871, were among the main difficulties which embarrassed water companies in London. Many of these regulations were in themselves good, but were so hedged by precautionary clauses as to render them frequently abortive.

In 1883 the directors of the New River Company were called upon by the Local Government Board to transfer certain districts within the area of their supply, containing about 22,000

old houses, from the intermittent to the constant system. Attention having been directed to their responsibility and to the difficulties which would have to be encountered, especially in the provision of suitable water-fittings, they empowered the author to introduce a system of testing and stamping fittings, with a view to aid consumers to obtain good fittings and to protect them from the annoyance and loss resulting from the use of inferior apparatus. The system then introduced had developed extensively, and there had been a material improvement in the quality of the fittings. Manufacturers who were at first antagonistic had become strong supporters of the system—so much so that the use of untested and unstamped fittings was in the district of the company mentioned almost the exception, and where such fittings were used they were invariably of the same strength and proportions, and in accordance with the regulations adopted by the company. Every fitting received to be tested was taken to pieces. Each part was superficially examined, gauged and weighed. It was afterwards stamped as approved by the company.

The idea of detecting waste by means of meters was introduced many years ago, and a method of measuring the flow of water in pipes in any given time was invented in 1854 by William Peace. The Deacon waste-water meter was that generally in use; it was compact, easily regulated, and fulfilled generally the requirements. Equally good results could be obtained from the Tylor meter as from the Deacon meter, although the working of the former was a little more difficult and the reading of the diagram was not so simple to the unpractised eye. Many years ago the Kennedy meter was used for the detection of waste in waterworks; the meter being placed upon wheels, was utilised, with a hose attachment, at any part of a district where it might be required. Very good results were so obtained, although the feature of measuring the quantity in a given time was not utilised. The Kennedy meter was now adapted, with a clock-and-drum arrangement, for waste-detection. Another suitable instrument was the Ginman meter, being an adaptation of the reflux valve in combination with a clock and drum; but it was at present little known or used.

The waste-water meter enabled an inspector to see at a glance the precise locality in any district where waste was taking place. The expense of the introduction of the system was considerable, the author's experience showing that in many districts in London it involved an outlay of about 150% for every 1,000 houses so controlled. This sum included the cost

ALBERT WORKS, ALBERT EMBANKMENT, LONDON, S.E.

of the meters and of fixing them on a by-pass, with sundries incidental to the fixing of valves for isolating the divisions of the district. In laying out districts for the waste-meter system care should be taken that the district to be controlled by the waste-meter was not too large. The author had found from experience that a 4-inch Deacon meter could well control about 400 to 500 houses; but districts smaller than this were desirable. Generally a large district was neither satisfactory nor economical in working; it necessitated more careful manipulation and the increased number of divisional valves added to the labour of the inspectors in order that accuracy might be insured. It was possible, with some contrivance, for a waste-water meter to control 2,500 houses, but an existing district could seldom be so arranged.

Although the use of waste-water meters was effective, and indispensable for a constant supply, it had been frequently urged that it involved a heavy initial outlay and annual expenditure for staff. The heavy outlay might be admitted, but the maintenance of an expensive staff exclusively in connection with the waste-meter system was an unfair inference from the facts. The system was indeed most economical, because it enabled the staff to efficiently cover and keep in order much larger districts than it could otherwise cope with. If the meters were, as they always should be, constantly worked, they continued to point out clearly the localities where waste existed, and thus to keep the staff continually on the alert. To deal effectually with the suppression of waste in large districts without waste-water meters, a very much larger staff of inspectors would be necessary, and even with a very large staff of inspectors a great number of hidden leakages would be altogether missed, which the waste-water meter effectually detected. The quantity of waste from this source had been found to be between one-third and one-half of the total amount of waste. In some instances meters were purchased and fixed at considerable expense, diagrams were taken off at stated periods, whilst few steps were taken to rectify the defects which the meters were constantly indicating. The meter system was then condemned as useless; whereas, in most of such cases the men in charge were really blameable and endeavoured to hide their shortcomings under a condemnation of the system.

The author then proceeded to describe in detail the system adopted by him for the efficient working of the waste-water meter system. By means of this system he had, dealing with an estimated population of 87,000 in Shoreditch, effected in the course of three years a diminution of waste and undue con-

sumption amounting to 720 million gallons per annum. This was effected at a capital outlay of 1,800*l.* and an annual expenditure for staff and establishment expenses of 926*l.*

ASSESSMENT OF IRONWORKS AND FACTORIES.

THE revision of the assessments of ironworks, factories, &c., at Wolverhampton by the overseers of the poor has led to greatly increased valuations. The basis of assessment had not been altered for 25 years, and many of the valuations have now been doubled and trebled, and in some cases even quadrupled. The assessment of a short section of the grand junction portion of the London and North-Western Railway, used chiefly for the cattle and dead meat traffic between Liverpool and London, and also as a through route for express passenger trains, has been raised from 270*l.* to 3,200*l.* That of the large ironworks of Messrs. John Lysaght, Limited, is increased from 2,030*l.* to 4,000*l.*; a portion of the Great Western Railway from 3,000*l.* to 5,200*l.*; the ironworks of Sir A. Hickman, M.P., are put up from 560*l.* to 2,170*l.*; the gasworks, 7,300*l.* to 13,940*l.*; the works of Messrs. Bayliss, Jones & Bayliss, 1,110*l.* to 2,760*l.*; and the Staffordshire Steel Company Limited, 560*l.* to 1,800*l.* Most of the breweries and hotels are quadrupled in assessment, and the valuations of the charitable institutions are also raised considerably. The assessments of the canal companies are unaltered, and reductions are granted on the tithes. The principal firms have convened a meeting with the view of arranging for appeals to a legal tribunal in the event of concessions not being made. The enhanced valuations will have the effect of yielding a larger revenue and reducing the rates, which are among the highest in the kingdom.

THE *Building and Engineering Journal*, in describing the state of affairs in Melbourne, says:—"A careful estimate of the present business in Melbourne and suburbs shows that the volume of trade has fallen away to about one-twentieth of what it was four years ago. This, of course, means that at least two-thirds of the architects and 75 per cent. of the builders have been thrown out of employment, and that the remainder cannot even then command sufficient to make their returns provide for more than barest necessities."

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.
ARGAND " 44 " " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.
WELSBACH " 10 " " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

THE AGE OF THE REFORMATION.

NATIONAL BUILDING TRADES EXHIBITION.

OWING to the early issue of *The Architect*, in consequence of Good Friday falling this week, several descriptive matters are necessarily held over. The programme of lectures is as follows:—Monday, March 19, 3.30 P.M., Mr. H. W. Burrows, on "Selection of Building Stone"; March 21, 3.30 P.M.; Mr. Frank Ashwell, "Warming and Ventilating." Same day, 8 P.M., Mr. F. R. Farrow, "Picturesque Buildings" (lantern illustrations). March 24, 3.30 P.M., Professor Norman, "Chemistry of Clays and Marls." Same day, 8 P.M., Mr. H. H. Collins, "Progress in Sanitation." March 28, 3.30 P.M., Mr. T. de Courcy Meade, "Advantages of Technical Museums in Advancing Sanitation." Same day, 8 P.M., Professor Banister Fletcher, "Architecture: its Civic and Commercial Value." The trade competitions take place on Saturday, March 24, at 3 P.M., and Wednesday, March 28, at 5.30 P.M.

Under the direction of Mr. Glenn Wesley, an excellent musical programme between the hours of 7 P.M. and 10 P.M. is rendered by Miss Eleanor Clausen's orchestra of young ladies, the Pompadour Band, Miss Eleanor Clausen acting as conductress. We now resume our notices of the exhibits as follows:—

Council Room.

Messrs. W. Turner Lord & Co., of 120 Mount Street, Grosvenor Square, have furnished the Consultative Committee-room in the centre of the building at very short notice in antique French styles of Louis XIV. XV. and XVI. besides English work of the Elizabethan, Adams and Georgian period. They show in this room carved oak Louis XV. panelling, being much engaged upon reproductive work characteristic of these periods in both plaster and carton pierre. But among other interesting reproductions are their special silks, chintzes and wall-papers, the latter being a very important department. The Council and Press-rooms are both lighted

by means of small arc lamps, made and lent by Girdlestone, Tatham & Co., of 16 Davies Street, Grosvenor Square. This lamp has been adopted by many of the leading electrical houses. The carved-oak panelling is in the style of Louis XV., a method of decoration very much in request at this time, while the furniture is also French, the writing-table corresponding in style with the panelling, as does also the kidney-shaped marqueterie-table and the gilt screen. The circular marble-top table is of the Louis XVI. period, the console table being Louis XIV., and the two chairs covered in green figured silk velvet correspond also with this date, but the covering is of an earlier period, viz. that of Louis XIII. The chair in tapestry is specially worthy attention, being a reproduction from the celebrated Beauvais works and of the period of Louis XV. The two chairs in plain green velvet are reproductions from Louis XIV. models. Special attention has been paid to the bronze-gilded metal mounts, with which the furniture is decorated. The hangings, curtains, portières, tapestries, &c., are exquisite, and we believe they are productions from the Royal School of Art Needlework at Exhibition Road, South Kensington.

Parkers, Limited.

Among the handsome specialties of Messrs. Parkers, Limited, of Conybere Street, Birmingham, is a massive fumed oak mantel and overmantel suitable for dining-rooms in large mansions and public buildings, &c., where a baronial effect is desired. For drawing-rooms is an elaborate one in dark mahogany. For billiard, library and smoking rooms is another handsome mantel and overmantel in fumed oak. Other mantels and overmantels are carried out in walnut, mahogany and pine woods. A mantelpiece in oak, specially designed by Essex, Nichol & Goodman, of Birmingham, for the New Municipal Technical Schools, should also be mentioned. For other details we must refer our readers to the notice in *The Architect* last week, but a visit should be made to the stand.

St. Pancras Ironwork Co.

The St. Pancras Ironwork Co. have in their stand the usual well-got-up display of stable fittings, pavement lights and staircases. They also show some very well-made specimens of wrought-iron doors, in accordance with the most recent requirements of the County Council. These have a 3-inch lap on all sides except the bottom, and the crevice here is blocked by an ingenious device, by which when the door, which is self-

Liverpool; 409 Keizersgracht, AMSTERDAM, &c

closing, shuts, a sill-piece rises from its previous flush position in the floor and covers the aperture, thus checking the flow of air or smoke. When such doors are fixed in pairs, as is usually the case, one on each side of a party wall, a fire would take a very considerable time to pass through. The same firm show also some good new designs of iron staircases, some of which are fitted with Mason's well-known patent lead and steel treads, at very moderate prices. A self-balanced glazed cellar flap and self-fastening safety coal plates seem to be great improvements on the old plans; and we noticed also some good designs of mosaic tilework, which allow a considerable amount of light to pass through without impairing the appearance.

Messrs. Jetley.

We have not been accustomed to see at any of the previous Building Exhibitions such works of art for interior decoration as are now being shown by Messrs. Jetley, of 8 North Audley Street, who have always aimed at correctness of style in their artistic productions. Their rooms, wherever we have seen them, either in carved oak or carton pierre, being in the present English, Renaissance, Jacobean, Italian or French, have always an artistic air and finish, showing a knowledge of styles and love of the work. Messrs. Jetley show us some of the French masterpieces of the last century, having had permission to reproduce from the originals the finest specimens of the Kings' Palaces at Versailles, Fontainebleau, the Château de Rambouillet and several others, the Louis XV. panels of the Château Doubise with Fables of Fontaine, also the Louis XVI panels belonging to the King's Study at Versailles. The parts of the ceiling of the Rambouillet are works which will greatly tend to raise the taste of our workers for interior art. We understand that Messrs. Jetley are able to reproduce all these great masterpieces of French rooms at comparatively low prices, as they have all the models and others in a great variety of styles at their show rooms at 8 North Audley Street, Grosvenor Square.

Moule's Patent Earth-Closet Company, Limited.

This company, 5A Garrick Street, W.C., have a fine variety of their well-known earth-closets, which are so useful in many localities. A model shows their adaptability for school purposes. High-class requirements, it will be seen, are provided by more expensive woods being used in the construction, beautifully polished and finished. Several new closets are also shown, for which patents have been secured. The large variety of these

earth-closets is no doubt due to their having been specially designed to suit all kinds of buildings, viz for cottages, gentlemen's houses and mansions, with another variety for servants' use, for hospitals, for infirmaries, schools, factories, unions, &c., for offices, others for invalids, &c. In nearly every case there is something special which renders it more suitable for the particular purpose.

British Metal Expansion Company, Limited.

Visitors to the exhibition have an opportunity afforded them of inspecting the patent expanded steel lathing at the stand of the British Metal Expansion Company, Limited, of Hartlepool, for fireproof works. The company can point to a long list of theatres and other important buildings where this as a fireproof material has been successfully used during the past two years. It has been used for "Constantinople" at Olympia, notably in the pillars and arches of the Hall of 1,001 Columns and the Galata Tower. The expanded lathing is made of the very best steel that can be got; also it provides a perfect key, and thirdly, it is completely embedded in mortar, and therefore beyond the reach of fire, forming a splendid protection for columns, girders, stanchions, &c. Architects and local authorities have adopted it for fireproofing staircases. Likewise it has proved its utility for walls, floors, ceilings, &c. The company have received some excellent testimonials as to severe tests it has withstood under outbreaks of fire and other catastrophes. The London showrooms are at 3 Lambeth Hill, Queen Victoria Street.

Hartley & Sugden, Limited.

Messrs. Hartley & Sugden, Limited, of the Atlas Boiler Works, Halifax, are well represented by a typical display of their celebrated boilers. As manufacturers of wrought-iron and steel-welded and rivetted boilers of every description, for hot-water apparatus, kitchen range boilers, gas boilers, hot-water valves, slow combustion stoves, &c., their reputation is already well known to our readers. During the past twenty years the firm have received over forty awards, including gold and silver medals at various exhibitions. The patent "Climax" boiler, a special favourite, is of course exhibited, also the wrought-welded "Premier" boiler, the "Gold Medal" boiler, the "Chatsworth" boiler, and a plain saddle boiler, the independent dome-top cylindrical boiler, an independent dome-top boiler with waterway bottom; this can be safely used with bad water. All sediment falls below the grate-bars, where it cannot injure the boiler, and manholes and covers are provided around

THE CUNNAH-WRIGHT PATENT CONSTRUCTION CO. L^{TD}.

GRACECHURCH BUILDINGS,

79 $\frac{1}{2}$ GRACECHURCH ST., LONDON, E.C.

WORKS: BIRMINGHAM.

A NEW LIGHT.

THE SOLAR LOX LIGHT

CAN BE SEEN ALIGHT NIGHTLY AT

UNGAR & CO.'S NEW PREMISES,

327 UPPER STREET, ISLINGTON.

Please note change of address from 52 Commercial Street, E., to
327 UPPER STREET, ISLINGTON, LONDON, N.
 (FOUR DOORS FROM ISLINGTON GREEN).

the bottom for cleaning out. The independent "Duchess" is a new boiler, very powerful and economical, and specially suitable for heating long ranges of pipes, where an independent boiler is preferred. The new independent "Chatsworth" boiler is an adaptation of the Chatsworth, designed for working with very shallow drainage, capable of heating long ranges of piping, and no brickwork is required. Independent harness-room boilers have patent open fire fronts and bars. For greenhouses, &c., there is shown the "Halifax" heating apparatus, and also the independent "Star" boiler (pattern E) and the "Palatine" (conical pattern), the "Alexandra" multitubular gas boiler with copper tubes and condenser to prevent back-draughts, and the "Stanley" boiler. The rivetted vertical steam boiler, with cross tubes in fire-box, is suitable for contractors, agriculturists and general purposes. A visit should certainly be paid to this stand.

King & Son.

A familiar exhibit is that of the patent "Honeycomb" wine-bin, previously exhibited by Messrs. King & Smith, now under the title of Messrs. King & Son. We have explained on previous occasions the novelty in the construction of this wine-bin. Tubes of terra-cotta, circular interiorly to shape of bottle, are stacked along the cellar walls, naturally fixing together solidly, as exteriorly the tubes are hexagon or "honeycomb" shape. Terra-cotta does not suffer from corrosion, and along with firmness, durability is secured. The tubes can be made to act also as refrigerators by evaporation after sprinkling them with water. Breakage of bottles is avoided, as each bottle is independent of its neighbours. Another advantage is no awkwardness in access to the cellar; in some cellars it is next to impossible to pass down framed racks.

Charles Batchelar.

The exhibit of Mr. Charles Batchelar, of 208 Holloway Road, is nothing if not a genuine building exhibit. Architects and builders not only require building materials, but they would find it difficult to get on without building plant. Among the indispensable appliances are ladders, spars, poles, boards, barrows, cords, putlocks, &c. The exhibit can scarcely fail to attract the eye of practical men, as at the first casual glance the character of the exhibit reveals itself. There is a good show of ladders, jointed ladders, painters' trestles, excavators' (navvy) barrows, garden (box) barrows and various other barrows, swing-back steps and other varieties of steps, trolleys, cords, pulleys, &c.

Frederick Jones & Co.

Messrs. Fredk. Jones & Co., of Perren Street, Ryland Road, N.W., again have a prominent exhibit of their patent British-made silicate cotton or slag wool, made from blast furnace slag, for which they have been awarded medals and certificates at a score of exhibitions. Since they introduced this material to the public some eighteen or twenty years ago, it has come to be extensively employed in buildings of every description, and architects now specify it largely for fireproofing, for deadening sound and for preventing the transmission of heat and cold. The various made-up forms which Messrs. Jones & Co. manipulate their silicate cotton into are practical and simple. Amongst these we may mention their "sheets" (between wire-netting) for lining floors, walls, roofs, partitions, &c.; their "strips" (on canvas) for winding spirally round hot or cold pipes; and their patented "combination slabs," *i.e.* fireproof plaster slabs lined on one side with silicate cotton. These slabs, which can be easily nailed up under the joists, form a perfectly fireproof and soundproof ceiling, and entirely obviate the old-fashioned sound-boarding as well as lath and plaster. It is obvious that, in addition to its other advantages for use in dwellings, silicate cotton possesses the merit of being incapable of harbouring vermin of any kind or the germs of insect life. We also notice that one side of Messrs. F. Jones & Co.'s stand is devoted to a display of specimens of their fibrous plaster—a new branch which they have recently added to their business. They show samples of ornamental panels for ceilings, ornamental and plain cornices, &c., as well as both fibrous and fireproof plaster slabs.

Walter Monnery & Co.

Messrs. Walter Monnery & Co., 69 Southwark Bridge Road, S.E., are exhibiting Fryer's patent ventilators and Fryer's patent cowls. The cowls obtained the highest award at the Edinburgh International Exhibition, and appear to have given general satisfaction, having cured down-draughts and smoky chimneys by causing a powerful up-draught. It forms practically a part of the chimney-stack, and there is no danger of the head blowing off in storms. The bearings move in oil, and there is neither friction nor noise. The principles of construction prevent any accumulation of soot, dust and dirt, and easy access is provided for examining the bearings and for using a sweep's brush. There is also a self-contained supply of oil which will last for years.

W. A. Hooydonk.

Mr. W. A. Hooydonk, of 2 Little Howland Street, Tottenham Court Road, shows his system for interior decoration, which is styled Dækoría. Where carved woodwork is not employed, owing to expense, ornamental effects have been produced by the use of carton pierre, &c. Mr. Hooydonk's Dækoría secures all the requisite ornamental effects without any liability to warp or shrink through heat or damp, or crack or become detached and fall off. Mouldings and panellings are one with the structure of the wall itself, and therefore cannot be detached. It is very adapted for ornamentation that has to stand rough usage in theatres, public halls, &c., as sharp blows even on ornament, which is in high relief, would merely cause an indentation. It is also fireproof. All mouldings and panellings are one with the structure of the wall itself, and cannot become detached. In jambs, columns, pilasters, small frames, &c., the whole is produced in one piece; there are no joints to open or crack. The stand forms a room, that is, there is one complete wall; the other three sides open. Columns carry the canopy which is necessary to form and show the ceiling. The work is carried out in Elizabethan style.

T. Potter & Sons, Limited.

We notice that Messrs. T. Potter & Sons, Limited, art metal-workers, memorial brass engravers, ecclesiastical and Mediæval metal-workers, have a good display at their stand of art metal and wrought-iron ornamental work, &c. We hope to refer to this exhibit later on at more length.

W. Gooding.

Mr. W. Gooding, of North Road, Holloway, is exhibiting his excellent system of treads, known as the interchangeable treads. The tread consists of a metal keeper or framework, fitted with pieces of rubber or other material, which project above the metal-work. A firm elastic footing is provided, and the durability is altogether surprising, as may be seen from some shown at the stand that have been in use for years. They are suitable for any kind of steps or stairs for ships, yachts, omnibuses, tramcars, and, practically, wherever a step or stair is required.

Turpin's Parquet Floor Company, Limited.

The use of artistic joinery and wood-carving is well displayed in the exhibit of the Parquet Floor, Joinery and Wood-carving Company, Limited, 22 Queen's Road, Bayswater. One feature in the display is a room, or, to speak more correctly, one side of a room entirely fitted up in carved oak. The fireplace is framed in a massive and handsome carved oak chimneypiece, with over-mantel having large central mirror and side mirrors with bevelled edges. Corresponding in effectiveness is the carved oak dado and upper panelling or filling, frieze, &c., finished off with a very handsome and elaborate cornice. Both in design and execution the mantelpieces, panellings, panelled ceilings, staircase doors, handrails, balusters, newels, &c., leave nothing to be desired, and the fine character of the material itself is well calculated to do justice to the pains expended in design and execution. In regard to solid wood-block flooring, improvements have been lately patented constituting it the best of well-known modes of interlocking wood-floor blocks. Oak, antiseptic beech, teak, pitch-pine and deal are used (not less than 1 inch in thickness) on concrete, wood and stone floors, laid on and secured by a waterproof patent cement composition bedding, which also penetrates the dovetailed groove-joints, giving additional strength; in other words, forming an extra bond to the already interlocked floor-blocks. The woods before being used undergo a special antiseptic process, which removes sap, hardens the wood, and renders it a sanitary floor, especially for hospitals, and public buildings, where mixed assemblages congregate. Turpin's patent thin parquets and portable parquets are from the mode of construction strong and reliable. It is often supplied for temporary use, as, for instance, in ball-rooms. The company have supplied over ten million feet super during the last fifteen years. Attention should also be called to Turpin's Italian marble and ceramic mosaics for floors and walls, and terrazzo pavements of excellent workmanship in appropriate designs.

Hayward Brothers & Eckstein.

The well-known specialties of Messrs. Hayward Brothers & Eckstein are on view at this exhibition. One feature of the exhibit that should attract attention is Hayward's patent steel lathing. Ironwork, when first introduced for constructional purposes, was expected to hold its own in case of fire, but experience has proved the contrary. The idea of encasing iron and metal-work has proved satisfactory, as a certain amount of metal-work adds the requisite strength to the material which, so strengthened, can resist fire and so give protection to such valuable constructive materials as iron and steel. Hayward's steel lathing, taking the place of wood laths used in days gone by, and covered with plaster, makes one of

the strongest of walls or partitions, and as a protection against the spread of fire, nothing could be better. It gives a very perfect key, and, judging from the tests it has undergone, it would succumb to no ordinary fire. We saw some samples, for instance, that had been subjected to the foundry fire for half an hour, and then quenched with water, the key still remaining. Between the studs a 2-foot centre is amply sufficient. Patented last July, already, we hear, about one million square feet have been specified for. A novelty shown is a patent sash ventilator, by the use of which air can be admitted to rooms from the outside without opening the window. In many cases windows and doors cannot be left open at all times on account of tramps and others dishonestly inclined, so this simple little device will prove valuable to many. Well-known specialties of Messrs. Hayward Brothers & Eckstein will be seen in the way of pavement lights, stallboards, rolling lights, iron cellar-flaps in guttered frames, balanced flaps, self-fastening coal plates, ventilating panels for pavement lights, circular staircases, &c. Hayward's ornamental inlet (or Tobin) ventilators and other ventilators, wrought-iron sashes, stable fittings, architectural and general castings, &c.

Shanks & Co.

Messrs. Shanks & Co., of Barrhead, Glasgow, and London, display numerous samples of their various appliances, which have deservedly gained a reputation amongst the general public. In addition various improvements are shown, to which it would be well to draw attention. One very simple but most important item is Shanks's new patent accessible waste, which is shown as applied to baths and lavatories, and is a great improvement on the old style of closed-in or inaccessible wastes. By a simple arrangement instead of concealed standing waste and overflow, there is an open recess in which the valve-rod works, and which is finished like the interior of the bath. The grating, of specially large size and opening, is fitted above valve with a slotted or bayonet catch arrangement, so that it can be removed with the fingers for cleaning or other purposes. The valve-rod being usually of strong nickel-plated brass, and working through this grating, is a most cleanly, strong and simple arrangement. The overflow is cast on immediately behind the waste recess, and enters the waste just above seal of trap. Every time the taps are turned on, a special nozzle, led from the taps to the top of overflow, throws a jet of clean water down the sides of the overflow channel, and so keeps it always clean. Furthermore, it is raised as high as possible in the

bath, so that the chance of overflow and consequent soiling is slight, except in the case of taps left running with waste valve closed, in which case the overflow is sufficient to take away all the water. Another novelty is seen in a new spray bath which is the cheapest yet in the market, notwithstanding the excellence of construction and tasteful get up of the whole work. The plate with drained soap dishes is of a beautiful piece of marble. Among the new patent water waste-preventing w.c. cisterns is the "Levern," a valveless syphon cistern. In this, mechanism has been reduced to a minimum, with the advantage that there are practically no parts to get out of order. The discharge is rapid and the action is nearly silent, and in addition secret overflowing is out of the question. The exhibit includes, as we imagine will have been divined from the opening lines of the notice, sanitary appliances of every kind in the way of varieties of baths, lavatories, combination closets, &c. In these days of schooling, attention may also be paid to the excellent lavatories of Messrs. Shanks for the use of schools.

John Grundy.

Mr. John Grundy, of Tyldesley, Manchester, and London, has afforded visitors to the exhibition a capital opportunity of inspecting his familiar system of heating by hot air, in the large section of a stove enclosed in a chamber of white glazed brickwork. The largest of buildings could be most effectually heated by the one shown with a constant succession of pure air warmed. Within the chamber are two large flues, through which the outer air enters, and thence is dispersed as warm air in any required direction through various sheet-iron tubes. A damper in connection with each enables the supply of warmed air to be regulated or cut off as may be requisite. In front of the chamber a handsome brass ventilator similarly allows the warm air to be supplied or shut off. Below this ventilator is an arrangement of three sections giving every facility for sweeping and cleaning from the front, and each is provided with a small safety pipe. At the side near the back is a manhole through which access can be got to the interior if necessary. Stoves or grates are arranged on the same general principle, but having open fire for warming rooms, the outer air being supplied from the back, and the warm air supplied at the top of the stove or high up in the room from the chimney breast, according to the fancy of the client. These are much used in asylums, hospitals, &c., halls of mansions, billiard-rooms, drawing-rooms, and other rooms in residences, &c. One of the great advantages of this system of heating, for which also

HEWETSONS, Tottenham LONDON, W.

Court Road, HOUSE FURNISHERS & DECORATORS

Extract from THE GENTLEWOMAN (Mrs. PANTON) — "You can find all the furniture at Hewetsons, or if you are dubious of your own powers, you could either send me the pretty catalogue to mark, or my daughter could choose them next time she is in town, if you liked. The catalogue should certainly be seen; it is entirely a work of art, and most useful to country residents."

CLUBS, HOTELS, &c.—DISMANTLING, CARPET-BEATING, &c.

HEWETSONS have always at hand a staff of steady and trustworthy men to send out to take up and relay carpets and entirely dismantle.

DECORATING.—HEWETSONS give ESTIMATES free of charge for PAINTING and all kinds of Interior Decorations: Structural Alterations, Sanitary Work, Electric Lighting, &c.

HUNTING AND SHOOTING BOXES completely Furnished at three days' notice for £150, £300, &c., and delivered, carriage paid, to any railway station in Great Britain.

HEWETSONS' NEW ILLUSTRATED CATALOGUE is the best and most complete Furnishing Guide published, and is forwarded free of charge. It contains ESTIMATES for FURNISHING HOUSES for £150, £300, £500, £1,000, &c., each article in detail, illustrated and priced.

ARCHITECTS' Plans and Designs exactly and faithfully worked to.

Tenders Free for ELECTRIC LIGHTING.

SANITARY Work, STRUCTURAL Alterations, and every kind of Interior & Exterior DECORATIONS.

440.—English Carved Oak Writing Table, Leather Top, on Casters, £15 10s.
Without Drawer and Pigeon-holes on Top, £10 10s.

N.B.—House and Estate Agency Offices (213 Tottenham Court Road),
SURVEYORS, AUCTIONEERS AND VALUERS.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

it is much in request by so many, is the evenness of temperature which can be maintained by its use. The latest patent stove, suitable for large buildings, halls, churches, schools, offices, &c., is circular exteriorly. Interiorly there is a central large tube, surrounded by about half a dozen lesser sized tubes. The fresh air is admitted through the latter, passes the fire-box and ascends the central tube thoroughly well heated, whence, as necessary or not, it can be branched off in different directions. One interesting feature of this system is that the management is so simple that anyone can look after them; in fact, we heard that a blind man is in charge of a large one in Yorkshire.

Eagle Range and Foundry Company.

The gold medal Eagle ranges are exhibited by the Eagle Range and Foundry Company, of 176 Regent Street, W., in a well-selected assortment, and several novelties which many will be likely to appreciate are introduced. The Eagle ranges have been for about a quarter of a century before the public, and have carried off forty-five first prize medals. Among other merits there is economy in several directions in fuel, and in dispensing with the need of brickwork for flues; the flues being of iron. They can be used as open or closed fires, and the amount of fire increased or diminished as required. For cooking purposes and also for pastry-work all has been devised to secure the utmost perfection possible by the means of regulating the draught; it almost amounts to turning on the fire or turning it off as required at a minute's notice. One of the handsome Eagle ranges shown has improved ovens, in this respect, that the oven door has not to be opened till the cooking is complete. This, we hear, is of great moment in the case of cooking pastry. The oven door is of glass, enabling the cooking process to be watched readily. The glass doors have been tested and found free from danger of cracking, and no steaming of the glass takes place, that objection having been specially provided against. The Eagle grate certainly deserves attention, and should be inspected by visitors. It is not a complicated arrangement, though a written description of it might lead one to think so. As to appearance nothing could well look more elegant than the sample exhibited. There are three pairs of regulating doors. When all are shut, in summer for instance, it is an ornamental adjunct to the room, hiding the grate. If one or both of the upper pair of doors be open, ventilation if required is obtained. These doors are useful in regulating the draught, causing the fire to burn up quickly, after which

quick, medium or slow combustion can be maintained. At night, or on occasions when the room may be unoccupied for an hour or two, a perfect guard against sparks flying out is secured by closing the lower ones. Also they act as a fire-screen, as by closing three either one or other side of the room can be screened from the open fire. There is no difficulty in opening or closing the regulating doors, no sliding or mechanical operation being involved. The advantages are readily seen on inspection of the actual grate. A very ingenious chimney-top is shown, and guaranteed to do away with smoky chimneys and down-draughts. The construction, however, is exceedingly simple, or rather construction in the way of mechanism is altogether absent. A disk slightly above the smoke aperture diverts all down-draught, and expels it to the outer air. From its simplicity in lifting easy access is had for sweeping purposes. The company's guarantee enables a purchaser to return the pot should it be found unsuitable, and the full value will be allowed for it; but this guarantee does not imply that they bear the cost of fixing the pot. The various ranges exhibited should be inspected, as it will be found that they are shown in different kinds to suit any particular requirements, from very extensive to more modest needs.

C. G. Picking & Co.

The firm of Messrs. C. G. Picking & Co., of Bounds Green Works, New Southgate, N., have a very interesting exhibit for architects, builders and contractors. They show their system of fireproof flooring, or, as it is called, the patent twin-arch interlocking fireproof flooring, of which Messrs. Picking & Co. are the actual manufacturers. The principles aimed at seem to have been the securing in the simplest ways of solidity and strength, combining all fireproof and soundproof qualities with safety of load-carrying power, or a maximum of strength with the minimum of weight and thickness. These aims have been carried out by adapting to hollow tubular blocks a twin-arch design, along with the employment in their manufacture of a material that is both strong and refractory. The proportion of hollow space is larger than in any other system; this, together with the absence of any concrete passing down through the thickness of the floor, offers effective resistance to the passage of sound. The lateral interlocking arrangement is emphasised as a most important feature in the design, additional strength and security thereby being attained. The sections are in 2-foot working lengths, and so made as to completely encase the under-flange of the supporting girders. It

is also relied on as important that this floor does not need the extraneous aid of concrete to give it strength, and that there is consequently no temptation to economise weight by the employment in the concrete of a combustible material like coke breeze, as is sometimes the case, the double-arched blocks possessing in themselves the requisite strength without the addition of concrete to carry a safe load of 5 cwt. per square foot. They need only the covering of fire-resisting grout supplied with them to form a homogeneous floor. The finished face may be of wood, tiles, stone, or cement. Such a floor does not exceed 6 inches in depth, saving in head room on each floor throughout a high building. If for any special reason a heavier and thicker floor is required, there is no obstacle to it being so constructed. Also the soffits of the tiles are provided with dove-tailed ribs that give a substantial key for plastering. Plaster so fixed has remained intact under severe fire test.

John Tann.

Few will enter the hall without noticing the display made by Mr. John Tann, 11 Newgate Street, E.C. Burglars and thieves, if objectionable members, or rather hangers-on of society, can at any rate have the credit of having called intelligence of a higher order than their own to successfully baffle their chance of robbery. The destructive agency of fire has also to be reckoned with. Those who have valuables to protect cannot do better than apply to well-known manufacturers from whom to purchase their safes. These are, or should be, well known, and among them the name of John Tann stands high. We have before now alluded to the specialties of Mr. John Tann. The assortment shown has no doubt been made representative for the purposes of such an exhibition as the present, and will give a fairly good idea of the excellent character of much else that could not be shown without an impracticable amount of space had been taken. As it is, every inch of space has been utilised, and reference will be made to a few of the interesting articles shown. What has not been made before is a special five guineas safe that will be valued by all, viz. the only one that has ever been made bent out of one piece of steel. For general and trade purposes many persons will be pleased to have so cheap a safe to replace the substitutes to which they have hitherto trusted documents and other matters that it would be inconvenient if not disastrous to lose. Commercial men, bankers, rich people, &c., have to be catered for on a more extensive scale, and what will suit their requirements will be supplied by Mr. Tann. A feature of the exhibit,

from the architects and builders' point of view, is the display of fire and thief-resisting doors and frames for party walls, &c. Among them is a special emergency fireproof party-wall door having a three-way bolt, in action ease and simplicity itself. Another useful specialty is a plate closet-door, with three-way lock, specially suited for a butler's department. There is also shown a fine and massive banker's bullion-room door, with vestibule and gate, fire and burglar-proof and drill and wedge-proof, the whole weighing something over two tons. For more particulars of the specialties of Mr. John Tann we cannot do better than refer our readers to our descriptive articles previously published.

Mintons, Limited.

Messrs. Minton, Limited, of 28 Walbrook, show a large number of wall treatments in ornamental tilework. In blocks of buildings devoted to the purposes of offices, it is quite common in these days to see the walls of corridors, passages, staircases, &c., entirely carried out in decorated tilework. The samples that are shown in the hall are complete in themselves with skirting, dado, border and moulding, filling and frieze; as specimens of artistic design and colouring and judicious combination they merit great praise. There is, in addition, a large assortment of ornamental tilework for all purposes and of ornamental pottery, but at the time of our visit these had not been more than unpacked.

E. Walker & Co.

The Health water-pipe (Walker's patent) is shown by Messrs. E. Walker & Co., of Heckmondwike, Yorks. As the name implies, the use of the pipe secures health, rendering impossible evils such as lead-poisoning, &c. It obtained the highest award at the British Medical Association's Exhibition and other two gold medals. The pipe consists of a strong wrought-iron tube with an internal lining of pure block tin, so united at their surface of contact as to be perfectly inseparable by the action of the water, thus producing the strongest and purest water-pipe ever made. All the fittings being lined and fitted together with ordinary threads, the interior is absolutely incorrodible and non-poisonous. No soldering being required, it is much simpler to fix than lead. Water running through this pipe produces no bad effect on the teeth, as is the case with wrought or galvanised iron pipes. Owing to its prominent internal smoothness, this pipe will do of a less bore than any other metal pipe used for a similar purpose. It is also well

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

WALL INLET VENTILATOR

WITH INDICATORS

(DARRAH'S PATENT).

Incorrect Indication Impossible. Only One Action.

In the above we have introduced a most important improvement. It consists of an Enamelled Indicator, showing from any position when the Ventilator is open or shut. By this means all uncertainty is removed, and any person can see at a glance whether the ventilator is acting or not. The ordinary ventilator is often rendered quite useless by being shut off when it is supposed to be open, the only means of ascertaining the fact for a certainty being by holding the hand over the inlet, which is often difficult of access.

We shall be pleased to send a Model of Full-sized Ventilator on approval, carriage paid to any Architect for inspection.

BAXENDALE & CO.,

Miller Street, Manchester, and Hanover Street, Edinburgh.

adapted for hot water, as the joints cannot be broken by expansion and contraction, as is so often the case with soldered lead pipes; it thus obviates numerous repairs.

Coalbrookdale Company, Limited.

This company has a magnificent display, the largest in the hall, the length of the space occupied being 72 feet. The contents of the stand was epitomised in the issue of *The Architect* that was published on the opening day of the exhibition. One most imposing exhibit is the display of the York Gates, originally made for the Vienna Exhibition. One interesting detail in the art working is the twisted work, to execute which a special plant was laid down (Tuddenham's patent). The balcony railings are like these gates and other railing-work shown, exceedingly graceful; as also the staircase-work, spirals, newels, balusters, &c. One spiral staircase, designed by Mr. F. T. Pilkington, is the same as the one in Winchester House. Last week we gave the names of architects and artists who designed some of the works shown. Among ranges there is a circular-fronted range (Richard & Barton's patent), the advantage of which is the increased light obtained upon the hot-plate. A new fireplace, designed by Mr. Benson, of Bond Street, has been beautifully executed, having a recessed overmantel, with a handsome bevelled-edged mirror. Parker's patent "Kyrle" grate, which was awarded a gold medal at the Smoke Abatement Exhibition, should be noticed, a great feature about it being that it is constructed for burning anthracite coal. A hob-grate, designed by Mr. Scott Morton, of Edinburgh, is fitted with a front that pulls out for a coal-box. Other fireplaces are from designs by various architects, Mr. Basil Champneys, Norman Shaw, &c., a dog-grate being by Colonel Edis, and another grate with a special brick back, designed by Mr. J. J. Stevenson. The cabinet-grate, designed by Mr. A. H. Macmurdo, is a very handsome one, with bronze panelling representing "The Village Blacksmith" in high relief, and which was modelled by Mr. Creswick. Some fireplaces with cabinet overmantels, the whole in iron, though perhaps not very expensive, are most handsome ornaments to a room. Attention should also be called to the radiators the company are now making, and, before concluding, a word should be said of the electric-lighting arrangements of the stand. This is an exhibit in itself, the handsome variety of electric fittings being those of Mr. Harry South, of Garrick Street, Covent Garden. Numerous photographs also are shown of works carried out by the Coalbrookdale Company.

Shannon File Company, Limited.

In their special department in the manufacture of all kinds of office and library desks, and the various specialties comprised under the Shannon system of filing letters, bills, receipts, &c., in cabinets, the Shannon File Company are unrivalled. In office and library desks there is a great variety. Hitherto business men and others have had to accommodate themselves to an ordinary stock-designed article, but the Shannon Company's specialties are meant to accommodate themselves to everyone's requirements, so that it is only a matter of inspecting and choosing the right article. They are exceedingly handsome as articles of furniture, but as to price, not costly considering the amount of work in them. The Shannon system of filing is simply invaluable for any engaged in a large way of business, and those who consider time lost is money lost. By this system everything wanted can be found at once, and documents neither go astray nor are lost. The exhibit is a most interesting one to visit, and it will give a proof of what ingenuity, when on its mettle, can produce.

Incandescent Light Company, Limited.

A most attractive stand is that of the Incandescent Gas Light Company, Limited, of 33 Queen Victoria Street, E.C. The company are the sole manufacturers and owners in the United Kingdom of Dr. Auer von Welsbach's incandescent gaslight system, used with coal, water or oil-gas. We have before this explained the system, but it may be mentioned that it consists in a special burner which can be screwed on to any gasfitting in two minutes. It uses half the gas that ordinary burners do and gives double the light, which is perfectly steady. It is therefore a most economical light, and it is said that the saving effected in consumption of gas in the first year covers its cost and maintenance. It is also a healthy light, does not vitiate the atmosphere, nor blacken ceilings or decorations. It appears also to be useful for taking photographs in dull weather and by night. The burner is a Bunsen burner, so that the gas being mixed with atmospheric air the combustion is almost perfect, and there are practically no unburnt particles either of carbon or other material unconsumed to vitiate the atmosphere. There can be no doubt about the brilliancy of the light, which, as seen in broad daylight at the stand of the company, is quite dazzling. The variety of fittings, globes, shades, &c., are exceedingly handsome, being designed with great taste, the Punkak lamp especially. The grouping of two or four lamps in one cluster, after the fashion of a chandelier, produces a

beautiful effect in lighting. The different modes of fitting up the lamps enables them to be used for any purposes of whatever kind, indoor and outdoor also. This exhibit should be visited, as it is seldom such a display could be arranged.

Baird-Thompson Ventilating and Engineering Co.

This company, 159 Queen Victoria Street, London, and 22 Bath Street, Glasgow, have a most interesting exhibit, having taken a very large amount of space, and it will be of interest to our readers to refer to a few of the many specialties that this company has made a reputation for among the many shown. A very perfect system of ventilation is shown for large buildings and ocean-going craft, steamers, sailing vessels, &c., by means of compressed air. It consists of a large air compressor or receiver, into which the air is driven or compressed by steam, gas, or any other motive power, to between 5 lbs. and 6 lbs. per square inch. From the receiver the compressed air is delivered through pipes to any part of the building or ship where a draught is required to create suction, and expel air and change it for fresh air. In this way pipes may be carried in any required direction. At the required positions a patent nozzle is connected with the delivery pipe, discharging the compressed air into a tube having an orifice opening direct on the air within the building or ship, and expelling the used-up or vitiated air. By careful tests made, it has been found that for every 5 cubic feet of compressed air that escapes from the nozzle 95 cubic feet of vitiated air are induced and expelled from the building or ship, proper inlets for the introduction of fresh air being distributed throughout the building or ship. The patent air propellers or fans for ventilation purposes have been subjected to repeated tests and have been found to drive a greater volume of air per horse-power than any yet in the market. The utility of these fans in keeping buildings, mills, &c., clear of dust, &c., is so well known that it is unnecessary to enlarge more on their merits. A fan is shown connected with a high-speed silent engine for ventilating purposes and forced draughts, for ships, &c., of a very great power. For use of hospitals, country residences, &c., an improved earth-closet is shown which gives an automatic discharge of earth whenever used, both directly before and after use—a novel and useful invention. A large filter—Atkins's patent cleanable filter—is shown, in which the reversed current used in the cleaning is made to thoroughly disintegrate the filter bed, causing considerable attrition between the particles of the filtering material and effectually

removing all impurities. This is especially suitable for swimming-baths, where economy of water-supply has to be considered, as also for general purposes where large quantities of water are required to be filtered for domestic and other uses, and for country residences, &c., for filtering rain-water. A very interesting system of heating, and one also very useful for drying-rooms of laundries, &c., is shown. Exhaust steam from an engine is condensed by a current of cold air that draws off the heat, giving condensed water at 112 deg. for boiler use. The heat from the steam is taken possession of by the air. There is no actual contact between the air and the steam, as they are in separate chambers, and therefore the warmed air is not charged with any moisture. These and other appliances will be seen worked by electricity. These are two or three specialties out of the many, for it is needless to say that, in addition, there is a representative collection shown of this company's well-known specialties in heating and ventilating appliances.

The Mangotsfield Pennant Stone Company, Limited.

One of the best exhibits in natural stone, that of the Mangotsfield Pennant Stone Company, Limited, of Shannon Court, Bristol, who have a splendid show of their stone, is well worthy of the attention of architects, surveyors, and all connected with the building trade. They show samples of edging kerbs, monumental work, and a beautiful font, designed by Mr. Walter Cave, architect, London, which has been much admired. Those who are thinking of building churches, schools, &c., and are at a loss where to obtain a good stone, should certainly pay this stand a visit, as there is a good show of walling, also steps, &c.

Sanitary Bath Company, Limited.

The Sanitary Bath Company, Limited, of New York, Detroit, Toronto, and 12 Miller Street, High Street, Camden Town, London, show their patent steel-clad copper baths. The patent steel-clad copper bath is constructed with an outside shell and an inside lining of planished copper, with highly-finished tinned surface. The rim is of polished mahogany, walnut, or other ornamental wood. The bath is supported by four ornamental iron feet, and the plug and overflow are nickel-plated. The bath is adapted to any class of fittings of whatever make, and will lend itself to any style of decoration, and being so well proportioned and compact, the weight is only about 100 lbs. The advantages claimed are:—It will last for

years; no repainting; no chipping of enamel; all open and accessible; no place for accumulation of impurities; it does not cool the water as iron or porcelain does; it is light in weight, and stronger and more durable than any other bath; the patent tinning on the copper resembles electro-plate; it will lend itself to any style of decoration; it is relatively cheaper than any bath made.

Mainzer & Farrar.

Messrs. Mainzer & Farrar, 18 Berners Street, W., have on view their excellent steel and bronze "Climax" and "Eclipse" casements. These are guaranteed as thoroughly weatherproof and of the best possible make throughout. They are made in bronze, steel and wrought-iron. They are shown with the latest improvements, perfectly fitted and finished, hung on steel pivots on gun-metal bearings, after the fashion of safe-doors, preventing any possibility of sagging, and, where required, furnished with condensation sill attachments. A double casement of this firm's "Eclipse" section is shown, which is entirely weather-proof, and offers the least obstruction of light of any we have seen, the usual centre-bar being altogether dispensed with, the casements so closing up on each other as to form a perfect weather-tight junction, forming one of the lightest and strongest frames that could be produced. The frames are of steel, and each casement is fitted with a stay for adjusting them at any position. A special opening gear for a single light or a series of lights is also shown—the "Reliance" opening gear. A feature of this opening gear is the absence of all strain on the down rod, a specialty of Messrs. Mainzer & Farrar, rendering the gear entirely free in its working. Sections of more ordinary casements are also shown, transom lights, samples of mosaic-work and also specimens of metal-work employed for the construction of casements of solid bronze throughout, for the residence of the Hon. Mr. Allsopp.

William Woollams & Co.

Messrs. William Woollams & Co., of 110 High Street, near Manchester Square, have a beautiful exhibit of artistic wall-papers, embossed flock papers, raised flocks, &c., all of which are guaranteed free from arsenic; real embossed leather wall-drawings in continuous rolls, &c. The Pompeian decoration in raised flock by Mr. Owen Davis is a very handsome decoration suitable for staircases. A new design by Mr. A. Silver, made in chameleon flock with suitable frieze, is very rich in effect, the colour of the flock being beautifully gradated, and giving quite a velvety

effect. The Persian design on a very rich metallic ground is an admirable example of the height of perfection to which this form has attained in paper-staining. The "Chatsworth" design, by Mr. T. W. Hay, is another large and beautiful design, in a style with which Mr. Hay is well acquainted. The "St. Quentin" design, by Mr. Brophy, is a well-drawn pattern, shown in many colourings, and is a very suitable drawing-room paper. The "Londonderry," by Miss Aumonier, is an admirable production of this well-known lady artist, whose work in the ladies' section at the Chicago Exhibition was much appreciated. The design consists of hollyhocks and lace, and, being printed in very delicate colours, is a very taking pattern. Another specialty is the real leather shown by this firm, embossed and decorated. It is made in lengths the same as ordinary wall-paper and is 21 inches wide, and the joins of the skins are not noticeable. This new feature in wall-hangings ought to be seen by architects who have the decoration of mansions where an outlay on good decoration is not grudged. The "Digby," a private design of Messrs. Woollams, made in "Anaglypta," drawn by Mr. Owen Davis, is suitable for ceilings as well as dados. The "Talbot" is another handsome design in relief shown in various methods of decoration. This firm, as is well known, takes an important part in the advance in modern interior decoration, and at Chicago gained the highest awards, besides having previously gained eighteen other medals. They are the original makers of wall-paper free from arsenic, and will gladly guarantee any of their manufactures in this respect.

Peace & Norquoy.

Improved folding partitions for schools, public buildings, &c., are shown by Messrs. Peace & Norquoy, of 70 Port Street, Piccadilly, Manchester. The use of partitions for drawing-rooms, schools, and many other places, is as old as the hills. Of all troublesome and maddening things the various systems employed for subdividing rooms have been the worst. Once shut there is peace, but in opening them the trouble begins, and too often when open they are an encumbrance and unsightly. The system of Messrs. Peace & Norquoy certainly supersedes all other methods for dividing and subdividing rooms. By this means a large hall can be divided, or the partition, by an easy gliding motion, folded back against the wall in two minutes, without leaving any obstruction on the floor. These partitions have been approved and specified by architects in the erection of new schools,

and adopted by various school boards. These patent folding partitions are suspended by rods and pulleys, which run on rails fixed to a beam, and are made in 2-inch panelled and moulded framing, with wood or glass panels, in sections about 3 feet 6 inches wide, hinged together and fixed in position with steel-faced flush bolts. The full-sized partition shown consists of a series of folding sections. The sections are suspended from carriages which run upon rails as usual, but in place of the sections being disconnected they are hinged together, or the sections constituting the entire partition are divided into two or more sets, and the sections of each set hinged together. The sections are hinged together so that they can be folded one upon another similarly to an ordinary lap screen. It will be seen that the adoption of hinging the sections together is a very great improvement. If required, every alternate section can be made to act as a door. The sections can be made either with glass or entirely with wood panels, or the sections can be of iron or steel, which would also act as a fire-resisting partition.

Robert Adams.

At the stand of Mr. Robert Adams, 67 Newington Causeway, S.E., are shown the celebrated "Victor" door-springs, which we have before now described at length. Among these are the following:—The "London Victor" S.A. spring hinge, which opens and closes silently from the half-circle; the "Crown Victor," which is D.A., and opens and closes from the angle of 135 deg, which is wider than any other spring on the market; the "Empress Victor" pneumatic spring can be fixed either inside or out; the "King Victor," D.A., with check for exposed positions; the "Hurricane Victor" D.A. spring hinge, without check; the "Queen Victor," S.A., with silent check. The reversible windows are also shown, which are not only now well known, but should be more generally adopted for safety of those employed in window cleaning. Also the Triumph sash fastener and the Pullman sash balance, of which Mr. Robert Adams is sole agent; the universal sash-light opener, link motion fanlight opener, Giant sash locks and various other sash locks, Glide fanlight opener, pneumatic fanlight opener with a most handy and ingenious check; the Scott fanlight and skylight opener, &c., and sundry stoves. Among the door-springs is one of a novel description—a combination door-spring which can be regulated so as to keep the door from entirely closing, thus superseding the use of a strap. Aluminium tape is used with the Pullman

sash balance (steel frame). It should be noted that the top and side balances can be applied to mullioned windows, thus enabling the architect to introduce light where it is mostly needed. The spring sash balances are adapted for old as well as new work, and can be used in many places where you cannot use weights and cord. They are easily applied, run noiselessly, and have a very attractive appearance, lasting much longer than cord. If the directions are carried out every balance will work perfectly and be really indestructible. The balance can be applied to old as well as new windows. Also shown are Robert Adams's new panic door bolts, new "Impregnable" bolt, and a new "Impervious" weather-tight case-joint just now introduced, which disposes of condensed water by passing it outside.

W. Garstin & Son.

Visitors to the exhibition will naturally find a good deal to interest them in Messrs. W. Garstin & Son's exhibit of marbles and granites, not merely from the variety, but from the architectural purposes to which they are applied. Some of the granites consist of Scotch, Bavarian, Norwegian, Swedish, American and Italian. These are subdivided into different specimens from each country. Messrs. W. Garstin & Son call particular attention to their Italian granite, which is their most recent specialty. This granite comes from the quarries of Bareno, the original working of which goes back to the year 1560. The present proprietor, the Cavaliere Nicola Della Casa, has by his great enterprise succeeded in making Bareno granite famous in all parts of the world, and has been knighted by King Humbert for his services in the extension of the granite industry. The enterprise is now being extended to this country, and we have no doubt that in the hands of Messrs. W. Garstin & Son Italian granite will be widely used. This specialty is much cheaper than many of the stones in the market; it has great durability, is free from cracks, vents or other defects, will stand an unusual strain without breaking, whilst, being free from hornblende or soft parts, it is not affected by the action of the weather or the acid in the atmosphere of large towns. There is thus a large scope for Italian granite in work requiring particularly hard material, whilst columns, pilasters, &c., can be employed of considerably larger dimensions than hitherto. Messrs. W. Garstin & Son have quarries at Aberdeen, with complete plant for cutting and polishing all their granites, whilst all marble-work is executed at their London works, 760 Harrow Road, W. They are in a position

to quote for granite for bridge, dock, railway and other engineering works. The patent non-slippery pavement, shown as a granite stair-tread, will be referred to next week.

H. F. Buchan.

Mr. H. F. Buchan shows his patent "H. F. B." brass traps and fittings, which are generally recognised in the trade as a great improvement on old methods, and plumbers' brass fittings of every description. The "H. F. B." sink trap is claimed to be the only perfect fitting for earthenware and other sinks, and being cheaper than lead saves its cost in fixing. There is a saving of two plumber's joints, too, by using the "H. F. B." for lavatory basins. The latest specialties shown are patent connections for connecting earthenware closet-traps to lead soil pipe, and another pattern doing away with a wiped joint. Mr. Buchan seems to have paid special attention to everything new in the brass trade, and from the fact that these improvements are the very latest, deserve the notice of visitors to the exhibition.

Ferguson & Sons.

Messrs. S. Ferguson & Sons have a large exhibit of the "Carlisle" fireproof and ventilating floor. The main claims are lightness and strength—advantages which are at once apparent and real, and have gained the approval of leading authorities on the subject of construction. Describing the "Carlisle" system briefly, the floor is composed of the ordinary steel or iron joists and a combination of fireclay tubes and

concrete. The joists are placed at from 2 to 3 feet centres, and the tubes are 12 inches, 13 inches, 14 inches, 15 inches and 18 inches wide, two being put together to bridge over the space between joists, and concrete being filled in between them, which forms a key to bind the two lines of tubes together. The

tubes run parallel with the joists, and the tops of each pair of tubes being segmental or semi-elliptic, the concrete encasing them forms a corresponding arch springing from the bottom flange of each joist. This arched construction of fireclay is capable of carrying three tons concentrated upon the square foot on the crown of the arch. This idea of the "Carlisle" emphasises its characteristic of lightness and strength; and another advantage we may refer to is the protection to ironwork which the floor affords—that is, including plaster, 2 inches protection to the underside of the iron or steel joist, with an air-space to promote radiation, or to intercept the conduction of heat to the ironwork. We do not intend to satisfy the curiosity of intending visitors to the exhibition on every point and detail. We would invite them to inspect the exhibit if they are at all interested in fireproof floors. We are sure that a careful examination of it will confirm the merits of the "Carlisle" as one of the best floors in the market, and soon, we hope, to be largely adopted.

Kingston Flush-Tank.

The Kingston patent "Silent" flush-tank is decidedly a novelty, and on an entirely new principle. The tank is constructed of cast-iron, the working parts of gun-metal. The lid is secured with four screw bolts upon a rubber seating, making a perfectly air-tight tank. There is no ballcock or overflow pipe used, consequently overflow is prevented. The valve is fitted with a screw propeller which the rush of water causes to rotate, consequently the valve frees itself from corroding deposit, and, by its varying position, makes a true watertight connection with its seating. This invention is certainly well worth attention.

Williams & Son.

Messrs. J. C. Williams & Son are well represented with a display of their improved close fire ranges of different patterns, radiators, manhole covers and general ironmongery. With the present rage for fads in ranges it is to the point to call attention to a range that is simple in construction, not made for effect, but for wear, and can be easily managed. All the portions of the range most subject to the action of the fire, such as the front bars, cheeks, bottom grate, are exceedingly strong and movable, and can be replaced at a small cost without taking out the range. The distinct specialty is, however, Messrs. J. C. Williams & Son's winding bottom grate arrangement,

Shorland's Inlet and Outlet Ventilators in
every Design.

which allows the fire to be raised or lowered, and effects considerable economy. We may remark that Messrs. J. C. Williams & Co. are actual manufacturers, and for over eighty years have been established at Reading, and acquired a reputation for high-class work. Amongst recent work the firm have placed ranges, &c., in the residence of the Duke of Wellington, at Apsley House and Strathfieldsaye, and carried out specifications from Mr. Alfred Waterhouse, F.R.I.B.A. Hot-water engineering work is another specialty of the firm. We shall refer in a subsequent issue to other details of the exhibit.

John Sutton.

Mr. John Sutton, of Peterborough, shows his patent chimney-cowl, which is claimed to be a preventive of down-draught—a claim which we think is perfectly justified. A system of sectional plates easily acted upon by currents of air from any direction attain this object. In another column will be found an illustration of this cowl, from which its merits will be easily gathered. Messrs. Seagrave & Co., Rochester Row, Westminster, are the manufacturers in London.

Cunnah-Wright Construction Company, Limited.

The Cunnah-Wright Construction Company, Limited, are to the fore with their system of construction in the form of a model bungalow, which is particularly light and attractive. We shall refer in a subsequent issue to this exhibit in more detail.

Ellis & Partridge.

A fine selection of ornamental brickwork is shown for Messrs. Ellis & Partridge by Mr. T. Freeman, of 200 and 202 Phoenix Street, St. Pancras, N.W., which will be fully described in our next issue.

T. Freeman.

Messrs. P. & S. Wood's blue Staffordshire bricks, copings and tiles are shown at this stand. The goods are made from the very finest of the rich silicious clay deposits in the Staffordshire district, without the admixture of any foreign or colouring matter whatsoever, and enjoy a high-class reputation in the English and foreign markets. The goods are guaranteed vitrified and coloured solely by the application of a sufficient and continued degree of heat, and necessarily vitrified throughout, in order to impel to the surface and flux the oxide of iron which forms a large natural constituent of the material, to produce the hard metallic face, and impart the rich natural

colour, for which the Staffordshire brick is so justly celebrated. The bricks have been tested. One indiscriminately taken from bulk (not specially prepared), treated by Messrs. Kirkaldy, of London, withstood a gradually increased thrusting stress to 438,940 lbs., and a mean average of six bricks so treated showed 380,108 lbs., or 9,507 lbs. on the square inch. These same bricks were previously immersed in water for twenty-four hours, and only gained by absorption 0.80 lbs., or 1.48 per cent. of their weight. They are non-absorbent and practically imperishable.

H. Bassant.

Mr. H. Bassant, West London Parquet Works, 87 Charlotte Street, Fitzroy Square, W., shows a high-class selection of parquet flooring, $\frac{1}{4}$ and $\frac{1}{2}$ -inch parquet, to cover existing floors, also 1-inch solid oak parquet. We understand they keep about 50,000 feet of various designs always in stock and ready for laying. The designs shown in the hall will repay inspection. As to methods of fixing parquet floors, Mr. Bassant guarantees all work fixed by his own workmen to be well glued, both tongued and grooved and secret nailed, and to be firmly fixed to existing floors and guaranteed not to move. Also $\frac{1}{4}$ -inch parquet to be firmly fastened to existing floors, and warranted not to curl up.

THE MANUFACTURE OF WHITE LEAD.

Two patents have been recently taken out which are intended to counteract, if possible, the ill effects which frequently overtake people employed in the manufacture of white lead. The object of the patents is to dispense with the direct handling of the lead from first to last by workers of the Dutch process. This is effected by what the inventor calls "the tray system," which may be applied both in the "stack," where the blue lead is converted into carbonate of lead, and in the "stove," where the ground white lead is dried. As it is in the "stove" and in the subsequent packing into casks of the dry white lead where the most poisonous effects are experienced, a brief description of the proposed new method may be of interest. The lead is transferred from the pots in the "stack," in which it has been converted into carbonate, by means of suitable tools, which avoid the direct handling of the lead, to boxes held in position on what are termed tipping trays. These are placed on trucks, which run into the grinding shed, where the boxes are unloaded by "tipping" into a hopper which feeds the grinding rolls.

Of Finest Quality,

FROM 3d. PER FOOT IN OAK.

HOWARD & SONS

Tender for Contracts for any Joiners' Work or Ornamental Plaster. Painting—Plain or Decorative.
Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

Each tipping tray is of a size to accommodate twelve or any other suitable number of boxes, which are clamped by cross-bars or other means to keep them in position when the tray is tipped or inverted. The shed is built as nearly air-tight as possible, is lighted from the sides and top, and has connected with its upper part an exhaust outlet to a fan, which draws off any dust that may arise in the operation of tipping, and leaves the atmosphere breathed by the workers untainted. The tipping is effected by causing the tray carrying the boxes to pivot upon a suitably supported horizontal axis at its front, and raising it off the truck by means of chain or other tackle attached to its rear, or otherwise applied to tilt it, until it is inverted over the inclined mouth of the receiving hopper. Water is sprayed upon the white lead as it is delivered to the hopper to prevent as far as possible the escape of dust, and to assist in conveying the white lead to the grinding rolls. The ground white lead is then filled into earthenware or copper pans, secured on trays and transported to the drying stove. This is a shed with pairs of supporting ledges arranged in superposed tiers to receive the trays. These ledges may be fixed to the side walls of the shed and to intermediate posts, and two or more series of tiers can be arranged side by side. Beneath each series is a tramway, upon which run waggons for depositing the trays on or removing them from the ledges. For this purpose each waggon is provided with an elevating table capable of being raised or lowered by a central screw, and in this way several tiers of ledges are brought within range of one waggon, several waggons of different heights being used. The loading of the drying stove is commenced by first raising the elevating table, so that the tray is just above the level of the uppermost pair of ledges, then running the waggon into the stove, lowering the table so that the tray rests on the ledges, and then running the empty waggon out. The operations are then repeated for placing trays on the ledges next below, and so on in succession. A turntable is provided opposite each entrance to the stove and sidings for the waggons not in use. The stove is divided into two storeys, similarly arranged and worked, the trays being raised by a crane to the waggons running on the tramways of the upper storey. When the drying is completed the trays are removed by running the waggons under them and lifting them off the ledges, beginning, of course, with the lower tiers. The trays are then transported to the packing shed. This, like the one before described, is closed on the four sides, lighted from the top and sides, and provided with an exhaust by which dust particles are drawn off into a receiver. A tipping

arrangement similar to that already described is provided, by which the trays are tipped so as to discharge the contents of the basins into a hopper. This hopper has a regulating slide, operated from the outside, by which the flow of the white lead into the casks placed to receive it is controlled. The empty and loaded casks are passed in and out of the sheds on trucks, and the cask while being filled is lifted by counter-weighted suspension gear, to which a tremulous motion is continuously imparted by a revolving cam shaft, to press the lead tightly into the cask. The suspension gear may consist of counter-weighted lever arms, carried by a sling attached to an overhead lever, upon which the cam acts, the arms being adapted to take under the bottom of the cask, and being so guided that they may be readily engaged or disengaged as required. The cask when filled is deposited on its truck, drawn out of the shed, and passed to the cooper to be headed up.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

- 4594. James Henry Jefferies, for "Improvements in bib and stop-cocks for water, petroleum, other liquids and steam."
- 4623. Thomas Lishman, for "Improvements in or applicable to chimneys and ventilating shafts."
- 4694. Christopher Francis Gough, for "Improvements in bib-cocks or valves."
- 4693. Edgar John Lording, for "An improved sash-fastener."
- 4708. John Chadwick, for "Improvements in or relating to chimneys and the like."
- 4723. Henry Harris Lake, for "Improvements in automatic fire-extinguishers."
- 4766. Edwin Harry Francis, for "Reversible safety window."
- 4785. John Robinson, for "Improvements in apparatus for domestic fireplaces."
- 4802. John Edward Foxlee, for "Improvements in valves."
- 4868. Francis Bennett Shuffrey, for "Regulating draught-plate."

COPPER ROOFING,

ORNAMENTAL.

EWART AND SON,

346 Euston Road, N.W.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

THE BLACKMAN VENTILATING CO., LD.,

Having acquired an extensive and special experience in handling many thousands of successful Installations for Mechanical Ventilation, invite correspondence from Committees, Architects, Builders, and others who are practically interested, and will be glad to forward printed matter to any address, and to submit Schemes and Estimates for

WARMING AND VENTILATING

any proposed or existing building. All difficulty in the employment or transmission of power to any part of a Building, wherever Electric Current is available for driving, can be avoided by using the

ELECTRIC BLACKMAN,

Or BLACKMAN FAN and ELECTRIC MOTOR combined (Watel's Patent).

Besides this it facilitates distribution of effect, and is extremely economical in working.

Head Office:—63 FORE STREET, LONDON, E.C. Branches at MANCHESTER, BRADFORD, BRISTOL and GLASGOW

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obliterated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

No. 208. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.

TRADE NOTES.

A LARGE clock has just been erected at the parish church, High Ham, Somersetshire, by Messrs. John Smith & Sons, Midland Clock Works, Derby. It has all the latest improvements and is guaranteed to keep very correct time. The dial is a square one of special design. The same firm have also just completed a similar clock at Corsley parish church, Wilts.

THE new offices for the Consett Iron Company, Blackhill, co. Durham, are being warmed and ventilated by means of Shorland's patent Manchester grates, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE regret that last week, through an error, the new address of the Homacoustic Speaking Tube Company read 6 Burton Street. It should be 6 Bruton Street, W.

MESSRS. HAM, BAKER & CO., of 13 Grosvenor Road, Westminster, S.W., have been appointed sole agents for the sale of Ruscoe's patent apparatus for drilling and tapping water mains under pressure, and inserting ferrules without shutting off or wasting water.

VARIETIES.

THE Worthing Town Council have at last decided upon a site for obtaining their water-supply. Eight alternative sites had been submitted by experts to the committee, who had selected three for the choice of the Council. At a meeting of the Council the choice fell upon a site near the chalk pit at Broadwater. It was decided to purchase seven acres from Colonel Wisden for 1,400l., with permission to construct adits as the consulting engineer, Mr. Mansergh, may advise.

THE Banstead Wood Estate has been sold privately. The mansion, which was built a few years ago from the designs of Mr. Norman Shaw, has cost about 60,000l. The estate has an area of about 486 acres, of which some 300 acres are in wood.

THE Local Government Board have sanctioned the proposal to borrow 10,000l. for sewerage at Wilmslow, near Liverpool.

AN exhibition of arts and industries has been opened in the Ulster Hall, Belfast, and will not be closed for nine weeks. The collections are varied.

ON a Brooklyn quay, in the case in which it came from Rome, and perhaps one day to be sold for freight and customs charges, lies a colossal piece of sculpture, the greatest effort

(says Mr. Lewis Fraser in *The Century*) of an art life of over twenty years, a life spent in hard study in America, France, Italy and England by a man whose artistic intuition can hardly be said to be second to that of any of America's sculptors. This statue, *The Spirit*, modelled by John Donoghue in Rome, was intended for exhibition at the World's Fair, but such a work calls for large outlay in material, models, castings, &c., and with the shipping of the statue Donoghue's resources were exhausted. There was no one to pay for its transportation to Chicago.

JOSEPH WHITEHEAD, said to be the oldest railroad contractor in Canada, died at Lincoln, Huron county, Canada, on March 12.

THE Poole Town Council have decided to form a committee in order that they may suggest means for marking and commemorating notable places, persons and facts in connection with the history of Poole.

A NEW church for the Wesleyans at Wolstanton, Staffordshire, is about to be erected from the designs of Mr. A. R. Wood, of Tunstall, selected in a recent limited competition.

THE Most Rev. Dr. Sheehan, Roman Catholic Bishop of Waterford, has resigned the presidency of the Cork Archaeological Society, and the members have passed a vote of thanks to him for his interest he took in their work.

THE pre-eminence of the position occupied by the Empire Theatre in the affections of the public has again been demonstrated, if such evidence be needed, by the crowds which have flocked to it during the Easter holidays. They went in the confident expectation of finding a good evening's entertainment awaiting them, and must have been hard indeed to please if they did not come away satisfied. The holiday programme comprises fourteen items, and among them there is not one which is not first-class of its kind, while their variety adapts them to all tastes. Among the artistes who appear in the course of the evening are such well-tried favourites as Paul Cinquevalli, Marie Lloyd, Charles Tilbury and Clara Wieland, and among the new-comers the "Avolo Boys" execute some remarkable gymnastic feats, the Ray-Nols are aptly described as "eccentric French duettists," the Russian Liliputian singers and dancers throw plenty of energy and grace into their performance, and the "Three Judges" give an acrobatic turn which possesses many new features. The two ballets, "Katrina" and "The Girl I Left Behind Me," retain their freshness and "go," and the "Living Pictures," of which there are no fewer than fourteen, are alone worth a long journey to see.

BUILDING AND BUILDERS.

THE new Credon Road schools, for the West Ham School Board, of which Messrs. Newman & Jacques are architects, will cost at least 20,000/.

LAUGHTON CHURCH, near Gainsborough, is about to be restored at the cost of Mrs. Meynell-Ingram, of Temple Newsam.

A NEW factory is about to be erected at a cost of 12,000/ for Messrs. Martineau & Sons in North Woolwich Road, Victoria Dock, from designs by Mr. W. P. Ryan.

MR. J. STATHAM DAVIS, architect, Birmingham, has in course of erection sixteen large villa residences and twelve smaller ones at Edgbaston and Sparkhill respectively (Birmingham); forty workmen's dwellings at Garrison Lane, Birmingham; a number of villas of varying sizes at Sutton Coldfield, and semi-detached labourers' cottages at Bromsgrove. These buildings are being erected by various contractors, and the style adopted is Gothic. The total cost is estimated at about 25,000/.

THE governors of the Ludlow Grammar School are about to erect new buildings at Gravel Hill, or on a site in Mill Street.

SIR A. BLOMFIELD is expected to submit sketch plans of the new West Sussex Asylum to the County Council at the meeting in May. The buildings are likely to be less extensive than originally proposed.

THE directors of the South-Eastern Railway Company have decided forthwith to extend their locomotive and engineering works at Ashford, Kent. The expenditure will be large.

THE Grand Hotel, Birmingham, is now being extended under the direction of Messrs. Martin & Chamberlain, at a cost of about 60,000/., by Messrs. Barnsley & Son.

NEW CATALOGUE.

THE illustrated catalogue of the "Gordon" duplex steam-pumps which Messrs. Hayward Tyler & Co., of Whitecross Street, have prepared is interesting for several reasons—one being that the firm have been able to demonstrate the superior efficiency of their pumps beyond the best of the foreign rivals. The pump, as is well known, is adapted not only for the water-

supply of buildings and as a means of protection against fire, but for many other purposes. It can be made to work lifts, cranes, and these adaptations are available for almost every occasion on which pumping machinery is required. The catalogue suggests the sizes and varieties of the duplex pump and, considering the quality of the work, the economical prices at which orders are executed. The reputation of Messrs. Hayward Tyler & Co. for hydraulic work is endorsed by the foremost engineers and architects. In the catalogue they have introduced an ingenious telegraphic code, which by itself suggests the system adopted in the offices of the firm. This peculiarity is worth the attention of philologists as well as men of business, for by means of it the labour of correspondence is minimised, errors in description become impossible, and the delays that are unavoidable with letters are avoided.

TUNNELLING IN EDINBURGH.

AN important part of the extensive scheme now in progress for improving the Waverley Station and its approaches is, says the *Scotsman*, the construction of a new tunnel to carry a double line of rails between the west end of Princes Street Gardens and the Haymarket. It, in point of fact, has been laid down parallel with the existing tunnel, from the south side of which it is only separated by an average distance of 20 feet. It is 1,012 yards in length, 18 feet 6 inches in height from the rail level to its inner crown; it has a diameter of 27 feet. The work, which has been going on steadily and most satisfactorily—not a hitch of any moment having occurred since the start—is expected to be finished about the month of August. At present the tunnel is being worked from three different points, and the state of the record shows thus:—From St. Cuthbert's Churchyard westward, 64 yards of covered way and 72 yards of tunnel have been built; from the Torphichen Street shaft eastward 380 yards, and westward 152 yards, have been constructed; and from the west end of the tunnel at Dalry Road eastwards there are 28 feet of covered way and 52 yards of tunnel executed. These figures give a total length of 748 yards dealt with, leaving 264 yards still to be tackled. Workmen are now working on four "headings," and the work proceeds at an average rate of about 30 yards a month. The tunnel, which runs at an average depth of about 20 feet below the street level, is constructed of concentric rings of brick, the number running from 4 at the ends where there is no great weight upon it to 6 and even to 8 in the centre, where the pressure from houses is great. These brick rings are firmly cemented together, and, to make the tunnel watertight, holes are left in the roof at certain distances, and through these cement grout is forced all round the outside of the brickwork at a pressure of 68 lbs. to the square inch. At certain points, also, where the tunnel has to carry a heavy weight, the solid oak beams with which the roof was timbered before the brickwork was built have been left in and bricked round so as to strengthen the tunnel overhead. There are manholes at a distance of 50 feet on each side of the tunnel, so arranged as to give an alternate manhole at every 25 feet. Three of the heaviest buildings the tunnel passed through were St. Mark's Church, the south end of the Caledonian Station, and the Torphichen Street Police Station. St. Mark's Church had to be underpinned, and now rests securely on brick pillars carried to the rock. In putting in the foundations

of the Caledonian Station at the south end special provision was made for the passage of the tunnel underneath by laying down beneath the foundations a strong bed of concrete, while at the Torphichen Street Police Station, so well apparently had it been built, and so careful were the contractors in tunnelling under it, that not a crack has appeared along its walls. The most of the property likely to be affected by the tunnelling operations was purchased beforehand by the railway company. The damage done to the buildings, however, along the route is very slight. It can be easily repaired, and though the tenants of all the houses went out as a precautionary measure—a good deal of blasting having to be undertaken—they are now returning to those properties under which the tunnel has passed. The tunnel itself, for the most part, is well founded on rock. A remarkable diversity of material was met with in making the tunnel, which was mined in the ordinary way, and not, as those at the Mound, pierced on the shield system. At the east end the rock met with was a hard burnt sandstone, and at the heading from the east end of the tunnel this is being attacked by diamond drills driven by compressed air. In the centre in working from the Torphichen Street shaft beds of blaise or dry oilless shale had to be passed through, while at the west end a sandstone resembling the Hailes stone was encountered. Besides these other interesting deposits were met with. At the east end there was a fine band of fireclay excavated. Red marl was got under St. Mark's Chapel, and beds of coal, several inches in thickness, were also disturbed. In the blaise beautiful fossils of ferns and fishes were found. At the commencement of the work in the centre of the tunnel there were originally two shafts, one at St. Cuthbert's Lane and the other still in use at Torphichen Street. These it is proposed to convert when the tunnel is finished into ventilating shafts, and it is likely that the two tunnels will be connected at these points, so as to admit of the old Haymarket tunnel enjoying the benefit of ventilation also. The new tunnel has a gradient of 1 in 610, falling towards the Waverley Station. At the Haymarket end it comes out with a skew arch at an angle of 42, adapted to the line of the street above, and in the roof of the tunnel here may be seen two sets of iron troughs which had to be put in to carry the water, gas and sewage pipes of the city. The contractors for the tunnel are Messrs. George Lawson & Son, Rutherglen, with Mr. Laing as resident engineer. For the railway company Messrs. Carswell & Bell, engineers, are directing operations, with Mr. William Rodger as local engineer.

ZINC AND ZINC ROOFING.*

I WISH, gentlemen, to give you what I believe to be the exact truth about zinc, mentioning both good and bad points in connection with it, and may I ask you clearly to understand that in speaking of defects I do not believe that zinc is more liable to them than any other material we have to do with. On the contrary, I believe that good zinc properly laid is less liable to defects than most other roofing materials. I shall simply mention defects that we may know how to avoid them. I believe that the best zinc is that manufactured by the Vielle Montagne Zinc Company. Without exception all publications that deal with the subject are agreed upon this point. Upon the first introduction of zinc into this country in 1844, the trades with which it was likely to interfere used every exertion to prevent its use. The workmen employed in laying it, being chiefly tinmen, were incompetent to the task, and care was not taken to use good zinc of sufficient thickness. The Vielle Montagne Company in 1861 took steps to improve the quality of the metal used in this country, and to prevent the use of thin gauges, also to improve the mode of laying zinc roofs. The ordinary commercial name of zinc, before it is converted into sheet and other forms, is spelter. I understand from the "Dictionary of Architecture" that zinc was perhaps first mentioned in the sixteenth century under the name of zinctum.

The principal ores from which the metal is obtained are the sulphide of zinc, more familiarly known as blende or black jack; the carbonate or silicate of zinc, also called calamine; and zinc spar and the red oxide or zinc ore. I have seen the ore in its natural state and the material after passing through the process of manufacture, though I have not actually witnessed the process myself. I read, however, that chiefly the sulphuret and carbonate of zinc is obtained by distillation by descent. The ore is roasted with charcoal and heated in peculiar retorts, and zinc is converted into vapour, condensed and then fused. The process of obtaining the zinc from the ore is fully explained in Gwilt's "Encyclopædia." Zinc is found in all quarters of the globe. It usually contains an admixture of lead and sulphur; when purified from these it is of a light blue colour, between lead and tin. Most of the zinc used by us comes from Belgium.

* A paper read before the Northern Architectural Association, at the Art Gallery, Newcastle, by the hon. sec., Mr. Arthur B. Plummer, F.R.I.B.A., surveyor for the diocese of Newcastle.

The ores are also found in Derbyshire, Cornwall, Flint and elsewhere in this country. In the Isle of Man zinc ore is called black jack. It is imported as calamine from Spain and the United States, and in the metallic state, either crude in cakes or rolled into sheets, from Germany, Holland and Belgium. Some of the Vielle Montagne Company's works are about 2½ miles from Liège, and the less important Nouvelle Montagne are about 10 or 12. The Vielle Montagne Company, in a pamphlet issued by them in 1893 in connection with the Chicago World's Fair, state that the number of men employed at the Company's various works and mines was 7,301. The metals with which zinc is naturally associated and which tend to destroy its malleability are iron, lead, arsenic and sulphur.

It is of great importance that it should contain no iron or lead; the Vielle Montagne zinc is practically pure and is also more ductile than other makes. Their spelter upon being analysed is found on an average to be practically pure and is as follows:—Pure zinc, 0.995; traces of iron, 0.004; lead and sulphuret, 0.001. Zinc is easily fusible and malleable when pure, and bad zinc is soon destroyed by air containing acid. Cast zinc is brittle when cold. If pure, it becomes malleable at about 20 degs. Fahr., and can be rolled into sheets which retain their malleability, as may be seen by the corner of one of the samples submitted which I have struck with a hammer. At very high temperature, such as 400 degs. Fahr., it becomes very brittle again. The presence of lead makes zinc too brittle to roll at any temperature, and should it contain more than about 1 per cent. of lead, should be rejected. Zinc should be cast at a low temperature or the metal will become very hard and some of it will pass off in vapour. A small percentage of iron renders most of the spelter, particularly English, unfit to roll. Zinc is of a light bluish-white colour with a brilliant metallic lustre; it slowly tarnishes in the air, but only superficially, the film protecting the metal from further oxidation.

Though naturally very brittle, it may, I understand, easily be rendered quite malleable and ductile by being subjected to a process of lamination. Zinc is more tenacious than lead; it is equal to five times the same substance in lead and about three-fourths of copper. The density of zinc is 7.190, that of lead 11.352. Hence a given substance of zinc is one and a half times lighter and four times more resisting than the same substance of lead, or, in other words, zinc is as strong as lead at a quarter of its thickness. Rain-water coming off a zinc roof may be collected for domestic use without fear of poison, as it does not contaminate water as lead or copper are apt to do.

I may mention, however, that water containing lime destroys the zinc; therefore cisterns or other constructions intended to be in contact with calcareous water should not be of zinc. Bad zinc or very thin sheets are liable to be destroyed by sea-air, and by the sulphuric acid in the atmosphere where much coal is burned. Portland and Roman cement do not injure good zinc. Zinc sheets should not be allowed to be in contact with iron, copper or lead; in either case voltaic action will set up. This occurs especially and more rapidly when moisture is present, and for this same reason zinc paint should not be used on ironwork. Where it is absolutely necessary to place iron in contact with zinc, then galvanised iron should be employed. If iron nails are used for boarding under zinc, they should have their heads well punched into the wood and be covered over with a stopping of oil, cement or putty.

The expansion and contraction of zinc are greater than those of any other metal. It is perhaps unnecessary to state that of course the thicker the metal the less its expansion and contraction will be. Zinc is acted upon by moist air and a film of oxide is formed, which, however, as also in the case of lead, protects the metal from further decay. The oxide does not scale off as iron, but forms a permanent coating upon the metal. Zinc is said to be oxidised to the extent of 130 grains per square foot in twenty-seven years, and nearly half of the oxide thus formed is removed by the moisture of the atmosphere. As with nearly all other materials, the ultimate destruction of zinc is almost inevitable, as the coating of oxide cannot completely protect the subjacent metal from further oxidation. The first coat of oxide is insoluble, but if the sheet be too thin the oxide penetrates, and the metal goes into minute holes upon being walked over. Impure zinc, as in the case of chimney cowl, is apt to be injured by the fumes from wood fires. It should not be laid on any wood boarding (such as oak) containing acid, which tends to hasten its decay, and fir boards should be dry and laid about half an inch apart. The "Dictionary of Architecture" says that when zinc is placed against bricks containing even 1·14 per cent. of soluble salts it is destroyed. This difficulty, or the fear of it, can, however, be easily overcome in the few places where such contact may be necessary by placing felt or a similar material between them. The following reference to soot is an extract from vol. 27 of the "Proceedings of the Institute of Civil Engineers of England":—"Soot is destructive to zinc, forming with it a galvanic couple, which is brought into action by moisture and acid in the air."

There is said to be no practical engineer's test for the quality of zinc. Good sheet-zinc is of an even colour without black spots, tough, and easily bent backwards and forwards without cracking. Inferior zinc is of a darker colour than the pure metal, and of a blotchy appearance, caused by the presence of other metals which set up a galvanic action and soon destroy the zinc. Pure sheet-zinc is very durable if well laid, and if used of sufficient thickness, and from its lightness and strength is a valuable, permanent and economical material for covering roofs. By referring to Hurst's list of comparative weights of various metals of similar thickness and areas, it will be seen that zinc is lighter than either wrought-iron, steel, copper, brass or lead. From a circular issued by my father about ten years ago, I find it is stated that, as an average, 100 feet super of pantiling weighs about $7\frac{1}{2}$ cwt., plain tiling $14\frac{1}{2}$ cwt., slating $6\frac{1}{2}$ to 9 cwt., lead 7 cwt., galvanised iron $2\frac{1}{2}$ cwt., and 18-oz. zinc $1\frac{1}{4}$ cwt. I find upon calculation, and comparing these weights with other publications and lists, that they seem to be approximately correct. Of course, it is unnecessary for me to mention to architects that the lighter the roof covering the lighter also is the roof construction required under the same. Zinc is affected by change of temperature even more than lead; there is therefore the greatest necessity for leaving it quite free to expand and contract. The joints should on no account be soldered, otherwise tearing asunder will be the inevitable result; and for similar reasons nails should not pass through the surface of the sheets or roll caps, there being various modes of securing them from beneath. In the table of expansion of metals of similar areas, &c., in Laxton's "Price Book," I find that for 100 feet in length, by an increase of 100 deg. Fahr. of heat, cast-iron expands $\frac{3}{4}$ of an inch, brass $\frac{5}{16}$ ths of an inch, copper $1\frac{1}{4}$ of an inch, lead $1\frac{9}{10}$ ths of an inch, sheet zinc $2\frac{1}{10}$ ths of an inch. In "Notes on Building Construction" it is stated that zinc laid on flats or roofs to which cats can gain access is soon corroded. It is also stated (as an extract from Bloxam) that an objection to zinc is that it catches fire at a red heat and blazes furiously. Gwilt's "Encyclopædia" also states that when it is heated red-hot with access of air it takes fire and burns with a beautiful greenish or bluish flame. So far as I can learn from other works, however, there does not seem to be sufficient authority for the statement that the urine of cats is destructive to good zinc.

Liquid ammonia oxidises and then dissolves zinc, if severely tested. I also find that it is stated in other works that

the best zinc on y gnites on a blazing fire, and never when the flame merely passes over it, and that it is therefore most useful for roofs, especially when the sheets are folded over, and thus exclude draughts; it is, however, undoubtedly acknowledged that it resists the action of flames at 700 deg. Fahr., and that lead does so at 500 deg. I may state that I have tested samples of Vielle Montagne zinc in an ordinary household fire, and have failed to ignite it. Roofs of zinc at Liège have been found to be still perfect after thirty and fifty-five years' existence respectively. St. Philip's Church, Dalston, is one of the early damaging examples of zinc roofing sometimes read about. This was built near the middle of this century, and at the time of the introduction of the metal into this country, and this roof had to be re-covered after seventeen years. I myself have no doubt that a thin gauge of inferior zinc was used and badly laid. My father more than thirty years ago covered a summer-house in his garden at Queen Square with, I believe, a not very thick gauge of corrugated zinc, and this roof is still in good condition. I have also seen numerous satisfactory examples of zinc roofing on the Continent, and there can be no doubt that the statement in Gwilt's "Encyclopædia" is correct. It is as follows:—"Good zinc, properly laid, has been proved by long (sixty years) experience in France, Belgium, Germany and Italy to be a secure, durable and economical covering; no detrimental effects from any particular climate are to be feared so long as care be taken to adopt the proper mode of laying, and to select the proper gauges of the best quality of zinc."

May I now mention that every sheet of Vielle Montagne zinc is stamped with their trade-mark, and that for roofing purposes the usual sizes of sheets are 6 feet by 3 feet 7 inches, 7 feet by 2 feet 8 inches, 7 feet by 3 feet, or 8 feet by 3 feet. Extra lengths up to 10 feet or 12 feet are, I believe, as a rule of extra cost. The Vielle Montagne Company, however, state that they make sheets up to 10 feet long without extra cost per foot superficial for the sheets of the gauges suitable, and recommended for roofing purposes (viz. Nos. 13 to 18 inclusive). It will be noticed that the words "roofing zinc" are stamped above the Vielle Montagne trade-mark. The number in the centre of this trade-mark refers to the gauge. The letter under the number varies, being the initial of the works where the sheets are rolled. The three figures under the trade-mark refer to the weight of the metal per foot superficial, in pounds, ounces and drachms. The thickness of zinc is indicated by a special gauge, which varies somewhat with different manufacturers. The old Belgian zinc gauge is as follows:—No. 8 approximate

B.W. gauge 26, and the weight 9 ounces per square foot; the numbers of the gauges rise one by one up to No. 16. The approximate B.W. gauge of this number is 18, and the weight per square foot is 26 ounces. The Vielle Montagne Zinc Mining Company have adopted a new gauge for zinc numbered 1 to 26, ranging from 0.004 to 0.105th of an inch. I may now perhaps mention the approximate weight and price per square foot of, say, four Vielle Montagne gauges of zinc. No. 13 weighs 17 ounces, and the average price is 6d.; No. 14, 18 $\frac{3}{4}$ ounces, 6 $\frac{1}{2}$ d.; No. 15, 21 $\frac{3}{4}$ ounces, 7d.; No. 16, 24 $\frac{3}{4}$ ounces, 7 $\frac{1}{2}$ d. per square foot. Very slight variations sometimes occur in the weight of sheets of the same nominal gauge. The thinnest gauge recommended for roofs is No. 13 Belgian gauge. No. 15 is better. Where used for gutters No. 16 gauge should be adopted.

The usual various Vielle Montagne gauges of thickness are from .026 to .070 of an inch; the thinnest of these are used for lining packing-cases and the next thicknesses for perforated articles, frets, &c. Messrs. Braby recommend 15 or 16, but No. 14 Vielle Montagne gauge is considered to be ample in London for roofing purposes if laid on boards; for roofs without boards and for gutters nothing thinner than 15 or 16 should be used. Nos. 17 and 18 are most suitable for gutters. For flats nothing lighter than 16 ought to be used.

I will now select and give the following information as to two Vielle Montagne gauges, viz. Nos. 13 and 16; the former is .029 and the latter .043 of an inch thick. The approximate B.W. gauge of the former is 22, latter 19; weight per square foot—former almost 17 oz., latter 24 $\frac{3}{4}$; the weight per sheet, 8 feet by 3 feet, former 25 lbs. 7 oz., latter 37 lbs. 2 oz.

(To be continued.)

THE engineer to the scheme for the construction of a bridge and railway across the English Channel has prepared the details of the expenditure proposed to be incurred under the Bill now before Parliament. The estimates show that the proposed works will cost 98,900l. They would be carried out merely for the purpose of demonstrating "the practicability of constructing and maintaining the Channel Bridge." In the event of the experimental works proving successful, it is proposed by the Bill to authorise the Lords of the Treasury to sanction the prosecution of the permanent works.

NATIONAL BUILDING TRADES EXHIBITION.

IN our introductory paragraph last week it was stated, in accordance with the printed programme, that the orchestral arrangements were under the direction of Mr. Glenn Wesley. We are informed that this is a mistake, and that Mr. Wesley is Miss Eleanor Clausen's agent in connection with the orchestra of young ladies she has trained, and which is known as the Pompadour Band. The Consultative Council on Wednesday afternoon paid a visit to the various exhibits in the Hall.

Vitreous Enamelled Glass and Tile Company.

The Vitreous Enamelled Glass and Tile Company, 38 Lime Street, E.C., show a splendid exhibit of their patent translucent enamelled glass and tiles in relief. A few samples would amply suffice to show the beauty of the materials, but the exhibit is characterised by an almost exhaustive display of the capabilities of these specialties in variety of designs for ornamental effect. No subject comes amiss for design or execution; pictorial, floral, jewel-like effects, and every kind of ornamental effect can be designed and executed, judging from the beautiful specimens exhibited. Although we have on more than one occasion described these specialties to our readers, it may be of interest to give a general description. Translucent enamelling in relief on glass and tiles is a means of decoration not only permanent in itself, but also in colouration, which cannot fade. Being vitreous and fired at a high temperature, it fluxes itself to the surface of the glass when soft from heat, and cannot be removed though it will take a diamond cut. On white glass an effect is gained both by reflected and refracted light by day and also by reflected light at night, giving a maximum of light combined with a delicacy of effect. It answers admirably for windows, door panels, fanlights, window blinds, inside sky-

lights, screens, ship saloon lights, lettered panels, lamp panes, finger-plates, fire screens. On tinted glass as a background, the ornamentation in enamel and gold, which is also fired in, and where required it can be silvered on the back, a very rich effect is gained, rendering it suitable for ceilings, mural decorations, friezes, panels, pilasters, fascias, &c. For Oriental and Eastern designs it is particularly adapted. On tiles the effect is quite a novelty, and almost any design can be produced. Artists and architects wishing to have their own ideas executed will find this a means of doing so economically. It can be fired in panels up to 80 inches by 45 inches, if required. For the purposes of windows, panels in doors, &c., the enamelled glass is shown transparent or semi-opaque, preventing anyone looking in from the outside in the latter case, or in the former case to afford a view from inside or outside. The enamelled design takes effect from the inside and outside by night as well as by day. For wall-panel decorations and ceiling decorations it is eminently fitted, and the decorations on silver and other glass have a peculiar charm owing to its sparkling brightness. For fascias and work of the like kind it is exceedingly well suited. The selection that the company have made for exhibition has evidently been most carefully and judiciously chosen to show what can be done in this class of work.

Yates, Haywood & Co.

The stand of Messrs. Yates, Haywood & Co., and the Rotherham Foundry Company, Limited, 95 Upper Thames Street, E.C., contains a large collection of their high-class specialties. One of the special exhibits is the patent "Quadrant" kitchener, with lifting fire and open or close arrangement. The fire is self-adjusting, raised or lowered to any point by one hand, without any rackwork, for it works on the quadrant which is at back. Economy of fuel and convenience for cooking operations are combined in this kitchener, which is of heavy metal well finished. There are several varieties of the "Quadrant" kitchener to meet special requirements. No. 300C is, for instance, a double-oven kitchen range, strong and well fitted with continuous plate shelf, high oven in strong cast-iron, low oven in wrought-iron, strongly protected by cast-iron saddles, ovens ventilated by steam outlet pipes, bright banjo latch and hinges, bright bracket tables under ovens, wrought fall bar, with draw-out fret and rack, swing smoke plate, with coves, ashes pan and cinder sifter, castings rubbed, hot plate ground and blacked, and fitted of course with the patent self-adjusting quadrant

HEWETSONS, Tottenham LONDON, W.

HEWETSONS, TOTTENHAM COURT RD., LONDON, W.

lifting fire. Among the high-class goods is a dark oak carved mantel and overmantel with bevelled-edged plate glass mirror. The fire-grate is handsome, enclosed by panels of hand-painted tiles and marble slips. In another case, beautiful lustre tiles are used for the panels, the mantel being of pine painted a glossy white, the overmantel forming a kind of gallery constructed with arches, columns, &c. No. 309 is panelled with handsome vitreous tiles, No. 23 is polished mahogany with hand-painted tile panels. There are also handsome marble chimney-pieces, Lavanda, Brocatella, statuary inlaid with Sienna, &c. The hospital hot-air stove, a tiled stove, as its name indicates, is used for hospitals, infirmary wards, &c. The Pinkerton grate is a novelty. Instead of a semi-elliptic or semicircular shape the grate is entirely circular, not displeasing in appearance. Stable fittings are also shown. We shall notice these exhibits again next week, including the Guinness range, &c.

J. Jonas.

The stand of Mr. John Jonas, of 38 Lime Street, E.C., is a very interesting one. Among the exhibits is the new improved automatic oil lamp (Ross's patent), which gives a light of 100 candle-power at the cost of one farthing per hour. The lamp itself is inexpensive, but the cost would no doubt depend on the degree of ornament designed. There can, from the form of construction, be no shadow under the lamp. That it is economical and also easy to manage there can be no doubt, and also smokeless and odourless. It seems altogether a very perfect lamp in all respects, and unique in small consumption of mineral oil. Many in these days prefer lighting by oil or by electricity to gas-lighting. Electricity is at present somewhat expensive. Gas fittings in the way of sun-lighting necessarily must be expensive, and ordinary gas-lighting of rooms is considered by many detestable, from absence of proper illumination, from its vitiating the air in the room and spoiling everything in the room. The sunlight oil lamp will come as a boon to many. There is no wick-trimming required, as the three wicks used merely act as feeders to a cotton ring and require renewing once in twelve months. The cotton ring which furnishes the flame has merely to be removed once a week and replaced by a fresh one. Several stands are lighted with the automatic oil sunlight lamp, viz. Messrs. Minton & Co., Messrs. Macdowell Stevens & Co., Fireproof Construction Co., &c. Another exhibit is the "Lucal" light, also the Comet light, as approved by the County Council for

lighting large open spaces. It is calculated that a light of 12,000 candle-power is produced at a cost of 3d. per hour, or a power of 4,000 candle-power can be used. The light being portable is another advantage. It is always ready for use and will burn any oil. The "Acme" vapourising and hot-air circulating stove is also shown. The stoves are arranged for an open gas fire, and means are taken to moisten the hot air by evaporation of water. The patent "automatic" oil economiser is a useful tank which is now used instead of casks and cisterns, provided with taps. Among other merits it combines safety with economy.

Harry South.

Mr. Harry South, electric-light engineer, contractor and manufacturer, art metal worker, &c., 10 and 12 Garrick Street, Covent Garden, makes a beautiful show of his artistic electric fittings at the stand of the Coalbrookdale Company, besides lighting various other stands. The dynamo is one of Crompton's, driven by Messrs. Tangyes, Limited, with a 7 horse-power nominal Tangyes' gas-engine. The lighting arrangements carried out by Mr. Harry South are well worth a visit, as every variety of fittings and glass shades, &c., are to be seen, as suited for drawing-rooms, dining-rooms, halls and staircases of mansions, &c., in the way of standards, pendants, brackets, electroliers with five or more lights, and handsome ceiling fittings. Single lights, grouped lights, &c., take all kinds of ornamental forms in brass and copperwork, the metals singly or in combination, of cast, hammered and embossed work, many showing very pretty adaptations of foliage design, rosettes and the like. A most pleasing feature of the exhibit will also be found in the "candle" fittings, so called from resembling a chandelier lighted by candles. In addition to all the before-mentioned, more ordinary fittings are seen, but carried out in such tasteful design that the difference is scarcely secondary to the higher class articles.

W. Garstin & Sons.

Last week we gave a notice of the British, foreign and general granites and marbles shown in excellent varieties for all architectural, building, engineering, decorative and constructional purposes at Stand 7, by Messrs. W. Garstin & Sons, of 760 Harrow Road, London, W., and the King Street Granite Works, Aberdeen. Among the specialties are their Bavarian and Italian granites. But at the present moment we wish to call attention to a very excellent novelty just brought out, in the shape of a non-slippery granite step. The special

Prices and Particulars on Application.

JAMES HILL & CO., 100^A Queen Victoria Street, London, E.C.

feature of the patent (Hornham's) is a simple combination of lead with granite. This is effected by two rows of holes jumped or bored in the front or wearing surface of the tread. The holes are about $\frac{3}{4}$ of an inch deep, and filled with lead cut flush with the surface of the granite. The lead and granite wear equally, nothing getting out of line or position, as in the case of lead nailed on wooden treads. The sample shown has been subjected to several tests, and the patent should meet with success, as it obviates the periodical axing of the ordinary granite steps. At any rate, it is well worthy of a trial, and the patentee, Mr. Hornham, is quite willing to afford architects, surveyors, &c., the opportunity of testing it.

J. C. Broadbent & Co., Limited.

Messrs. J. C. Broadbent & Co., Lim., 73 Basinghall Street, London, E.C., of Huddersfield and Hazlehead, near Sheffield, manufacturers of silicate cotton or slag wool, show a model of a building to demonstrate the various methods and uses of the silicate cotton or slag wool in its application to buildings. This material is a mineral fibre made from blast furnace slag. In the model the application of slag wool for floors, partitions, roofs, pipes, cisterns, baths, &c., is shown.

Joseph Williamson & Co.

Messrs. Joseph Williamson & Co., Midland Foundry, Wellingborough, Northamptonshire, show five of their new patent "Graphic" kitcheners (with rising bottoms), ranging in size from 3 feet to 5 feet. The fire can be regulated from a depth of 12 inches to 6 inches. The lifting of the fire is simplicity itself, effected by the mere turning of a handle, without levering up or anything of that kind. In each case, owing to the slope, at any stage the fire is always well to the front for roasting, toasting, warming up, &c.; another advantage in addition is economy as to fuel. Another feature to be seen applied to these stoves is a rising table, which rises exactly with the lifting of the fire, useful for warming up and other cooking purposes, roasting, &c., for heating plates, also irons for ironing linen, &c. The fire has thus three stages—low, medium and high. The stoves have the usual requirements as to ovens, plate racks, boilers, &c. The boiler, though more expeditious than the usual run of boilers, is smaller, and so there is a saving of space. The stoves are well finished off with tilework and bright metal fittings, tables to ovens, which are easily let down and fall flush with the front when not required for use. The "Graphic" stove, No. 513, when lighted in the hall showed an average oven temperature of 210 deg.

Fahr. all the afternoon and evening. The stoves are made of strong and heavy metal, and any portion, if required, can be replaced or repaired with ease, as all the parts can be taken to pieces by any one.

Linoleum Tile Company, Limited.

The Linoleum Tile Company, Limited, 26 Shaftesbury Avenue, London, W., show their noiseless and inefaceable inlaid linoleum tiles for forming solid inlaid floor coverings which can be laid on wood, stone or cement with as good an effect as encaustic tiles, without being so expensive. These tiles are especially adapted for use in churches, hospitals, clubs, hotels and large public buildings, as well as for entrance-halls, offices, libraries, ships, smoking-rooms. They are noiseless and pleasant to walk on, waterproof and warm to the feet, not slippery, and will neither buckle nor blister. The colours and pattern retain their brightness after years of wear, as they are solid, go right through to the backing, and consequently do not fade until the material itself is actually worn away. Any pattern can be renewed at a few days' notice, whereas the ordinary designs in linoleum, &c., can seldom be matched after once being laid down. When any special part becomes worn or accidentally damaged, it can immediately be replaced without disturbing the remainder of the floor-covering, thus effecting a great saving in renewals. Waste of material in fitting awkward corners, &c., is entirely obviated, as the linoleum tile is cut in sections varying in sizes, and the purchaser only pays for the actual amount of material employed. Any variety of colours can be had in heraldic, æsthetic, grotesque or other designs, and any pattern, crest or monogram can be made. Different patterns are shown as executed in the waiting-rooms of the refreshment bars at Liverpool Street, for the Great Eastern Railway; also for the Great Northern Railway, and for corridors and lavatories for the London School Board, these last being fixed on stone. The linoleum tile floor covering is to be found used all over London and the provinces. Among a few of the noteworthy buildings are Windsor Castle, Bank of England and Bank of England branch at Newcastle-on-Tyne; Royal Horse Guards Cavalry Barracks, Windsor, &c.

A. G. Bell.

Mr. A. G. Bell, of Sherwood Street, Nottingham (Messrs. Alfred Appleby & Co., London agents, 85 Gracechurch Street, E.C.), exhibits Bell's patent fire-resisting doors and frames. These doors are made of wood with an interior lining of

asbestos. Doors also are exhibited that were subjected to fire, and after twenty-five minutes, although the woodwork was burnt on one side, the packing effectually prevented the fire passing through the door. The doors are non-conductors of heat; they are designed in any style to harmonise with the other doors and general fittings of the building; they are not awkward to open like iron doors, for as they are not much heavier than ordinary wood doors they open easily and are noiseless in work; by using either a door spring or rising butt hinges they can be made to close automatically—a most important desideratum in a fire-resisting door; they can be used in many positions where iron doors could not be placed, such as between the wards in asylums and hospitals, between various departments in warehouses, at the end of corridors, in hotels, mansions or public halls; they will be found most valuable in connection with hoists—by using these doors as trap-doors to each storey, they completely cut off one floor from another and thus hinder the hoist acting as a huge chimney; they are very moderate in cost.

Leeds Steel Works, Limited.

The exhibits of the Leeds Steel Works, Limited, Leeds, makers of basic Bessemer steel girders, channels, tram rails, rounds, angles, flats, billets, blooms and slabs, are shown by Messrs. H. J. Skelton & Co., 12 Lime Street, London, E.C., being various sections of rolled steel joists, girders, &c., constructional work, &c. All information as to the varieties, sizes, load carriage, &c., will be found by consulting the illustrated sheets and catalogues. The company make a specialty of iron and steel of difficult shapes and sizes; unusual sections to all tests and specified chemical analyses; large stocks for quick deliveries. Pig-iron, cold blast and hot blast. Wrought-iron in bars, plates, sheets, hoops, strips, angles, tees, channels, rods, wire, wire rods, forgings and sections. Mild steel in ingots, blooms, billets, slabs; tin-plate bars, wire rods, wire, rails, bars, plates, sheets, hoops, strips, angles, tees, zeds, channels, rolled steel girders or joists, forgings, and all sections. Castings in iron or steel from $\frac{1}{2}$ lb. to 40 tons weight each. Galvanised iron or steel in plates of 1 inch thick down to sheets of 30 B G plain or corrugated. Rails and fastenings for railways, tramways, mines, &c., in iron or steel. Rivets, bolts and nuts, spikes, coach screws, set screws, nails. Engines—blowing, exhausting, pumping, winding, hauling, air-compressing, tank loco's, rolling mill engines, foundry and iron and steel works plant. Steam hammers, hydraulic machinery, Roots' blowers,

foundry plant, cupolas, &c. Flanged, pressed and dished plates; corrugated flues; boilers; iron and steel roofs and girders.

Cameo Woodworking Company, Limited.

The Cameo Woodworking Company, Limited, 11 Billiter Square, London, E.C., exhibit their decorations as manufactured in England from natural solid wood. These decorations are reproductions by machinery of hand-carved mouldings, panels, borders, friezes, inlays, marqueterie, &c., of high artistic effect and finish, cheap in price. The Cameo woodwork is especially suitable for the building, cabinet maker's, railway carriage and shipbuilder's trades, and in general for all purposes where high-class effects are to be obtained at a moderate outlay. The decorations are durable, and can be applied without fear of clashing by the side of expensive hand-carvings. They are manufactured in quantities in all ordinary woods of commerce and in suitable lengths. For borders, friezes and mouldings it should be noted that all patterns are continuous, unlike tiles, without any break in the pattern, and they can be made in almost any thickness of solid wood. Higher artistic effects, at a comparatively low price, can be obtained by the application of the Cameo woodwork than is now procurable by use of other decorations. The Cameo woodwork is waterproof and may be cleaned like ordinary hand-carved wood. Very elegant effects at a small outlay are obtainable by using the Cameo woodwork for dados, ceilings, &c. Design and pattern cause no difficulty in this process, and thus it differs entirely from those processes which are confined to the production of geometrical designs only.

Paragon Bolt Syndicate, Limited.

The Paragon Bolt Syndicate, Limited, 14 Sherborne Lane, London, E.C., show an excellent and most easily worked tubular bolt for doors, windows, &c. The use of bolts on room doors is very old. In many cases they are used as an extra protection in addition to locks, and placed outside the doors of the various rooms in houses, to render it more difficult for burglars getting further into the house than the actual room they have entered. A certain amount of unsightliness has to be put up with, but by use of the "Paragon" bolt instead of ordinary bolts the unsightliness is done away with, as the "Paragon" is ornamental rather than otherwise. Other advantages of the "Paragon" as compared with ordinary bolts are:—Great strength—it is not dependent for security on a few small screws in the socket; exceeding neatness, no beading to be cut away for

THE INCANDESCENT GAS LIGHT

(WELSBACH SYSTEM).

One "C" Burner gives a Light of from 60 to 70 Candles, with a Consumption of $3\frac{1}{2}$ Cubic Feet of Gas per Hour.

TREBLE THE LIGHT OF AN ORDINARY GAS BURNER WITH HALF THE CONSUMPTION OF GAS.

NO SMOKE, SMELL, OR DIRT.

CAN BE ATTACHED TO ORDINARY GAS FITTINGS.

Two Independent Scientific Opinions:—

The President of the North of England Association of Gas Managers, in his Inaugural Address delivered at Middlesbrough on October 7, 1893, spoke of the light as "The latest development in economical lighting by gas . . . which reduces the cost to ONE-SIXTH OF OUR STANDARD (i.e. the Argand) or one-fifteenth of the cost of electric light" (see *Journal of Gaslighting*, October 10, 1893).

Herr Dicke, in a paper read before the German Gas Association, stated the AMOUNT OF HEAT developed by the different sources of light to be as follows:—

COAL GAS.

ORDINARY BURNERS, 50 calories per candle per hour.

ARGAND " 44 " " " " "

SIEMENS' BURNERS, 23 calories per candle per hour.

WELSBACH " 10 " " " " "

Superior to Electric Light and one-eighth the Cost. Special quotations for large installations.

FOR FURTHER PARTICULARS, APPLY TO

THE INCANDESCENT GAS LIGHT CO., LIM.,
14 Palmer Street, Westminster, London.

socket; shoots smoothly and requires no force; dropping of door does not affect working of bolt; has no springs, and is practically everlasting; upper bolt on door can be fixed within easy reach, not of necessity at the top of door, as with other bolts.

E. P. Bastin.

The exhibits of the Rowlands Castle Brick, Tile and Terra-Cotta Works, Rowlands Castle, Hants, at Stand No. 84 comprise a small erection in this firm's well-known dark and rich red facing bricks (very similar to the noted Fareham reds), with ornamental bricks, panels, pateræ, ridge tiles, finials, &c. The plain and ornamental bricks are sand-faced, and are all hand moulded. They are made from plastic clay of very good quality; the deep red colour is obtained by careful preparation of the clay and thorough burning of the manufactured goods. No colouring matter is used. These bricks have been proved by Messrs. Kirkaldy to stand a pressure of over 300 tons per square foot before crushing, and have been used for facing many important buildings. The two projecting piers are built of Holloway & Bastin's patent tiebricks for bay windows, &c. These patent tiebricks will be found well worth examination, and it is claimed have many advantages.

The above sketch of the patent tiebricks for piers of bay windows, &c. (Holloway & Bastin's patent), shows the construction of two piers of a bay window. It will be seen that the arrangement is very simple and effective, a stronger pier being built in less space than where ordinary bricks are used. The tiebricks are made reversible and handed, so as to insure a good bond at every course, and, if built in cement, will form as strong a pier as one of solid stonework of the same section. The strength of the pier may be further increased by building iron bars in the recesses marked A. There is no cutting and waste of materials for forming the piers, and consequently there is a saving of time and expense. Perfect shape is insured, with faces and angles true; each brick repeats itself in each course with accuracy. In the construction of piers in the ordinary way, rubbish or shapeless bats are sometimes worked in, which instead of giving strength are actually dependent on the cement or mortar used to keep them in position. Architects, by specifying that Holloway & Bastin's patent tiebricks shall be used, will insure that the piers in the building are equally solid throughout.

Ashwell & Nesbit.

Messrs. Ashwell & Nesbit, of Leicester, and 14 John Street, Adelphi, London, show an installation of their patent "Leicester

Plenum" system of warming and ventilating buildings, comprising wet and dry filter, fan driven by electric motor, Ashwell & Nesbit's battery of heating surface, flues, gratings, &c., connected with a room constructed and fitted up most tastefully as a sitting-room. Space unfortunately will not be sufficient to describe the merits of the system. The testimonials received from the Leicester School Board and the medical superintendent of the Nottingham Borough Asylum prove these merits. One feature is the ease with which an equable temperature can be kept up throughout. Another thing is the arrangement for preventing the air, as it would at times, getting too dry. There is also a good filter which effectually eliminates from the air all impurities, dirt, dust, smuts, &c. A variety of very efficient radiators, having a large surface in a small compass, are shown. The "Solar" radiator, equally applicable for steam and hot water; the "Solar Ventilating" radiator, equally applicable for steam and hot water. This radiator is free from the faults common to most ventilating radiators. The passages for the ingress of the fresh air are large and smooth, and will not thus harbour dust; they are straight, and can therefore be readily cleaned; the valve for shutting on and off the fresh air is cheap, simple and efficient. The radiator can be made up in any number of loops, from two upwards. Wrought-iron weather-tight casements of the firm's own sections and manufacture. A ventilating open fire grate for warming incoming fresh air. A ventilating open fire hospital grate with descending smoke flue. The "Meldrum" patent forced draught apparatus as shown on a Cornish boiler (Meldrum Bros, 16 Union Court, E.C.), in which the steam passes altogether under the fire; and the electric motor for driving fan and electric-light installation (Edmundsons, Limited, Great George Street, Westminster).

C. G. Roberts.

The excellent patent of Mr. C. G. Roberts, Haslemere, Surrey, for utilising rain-water is shown. There is the vertical rain-water separator and the horizontal rain-water separator. The appliance we have before now described and fully explained. It has nothing to do with filtering water. Its function is simply to convey pure rain-water from the roof as it falls to a tank or proper receptacle. There is nothing particularly complicated in the construction, but it is so arranged only pure water is collected, the washings of the roof having first run away to waste. The vertical separator is used where a single stack pipe carries the water from the roof to the tank. One length of the stack pipe is removed, and the separator is inserted and fastened to the side of the house. When a building is provided with several stack pipes connected by an underground pipe leading to the tank, a different form of separator is used, the "horizontal separator." The rain that falls upon the roofs of most dwelling-houses is sufficient in quantity to furnish all the water that is needed for household purposes; the area of the roofing in most farm buildings is also amply sufficient for collecting all the water required for horses, cattle, dairy and engine. The inferior quality only of the water has hitherto prevented its more general use. Provision is made in most country houses and in many town houses for storing rain-water from the roof, but many who have sought to avail themselves of this cheap and constant supply have been disappointed at finding water so collected seldom fit for use. The rain that first falls upon a roof brings down from it all the soot, bird-droppings and other impurities that have been accumulating since the last shower. Under ordinary circumstances, these are all carried into the storage tank. The insoluble portion of these impurities settles at the bottom, only to be stirred up again by every fresh fall of rain. Such water, at its best, holds in solution deleterious substances not removable by ordinary filtration. The rain-water separator can be fixed up by any ordinary workman. It is self-acting, and after rain has been falling for a certain time, the separator cants and turns the pure water into the storage tank.

Fireproof Construction Company.

The Fireproof Construction Company, 11 Victoria Street, Westminster, exhibit the "Hygienic" fireproof block partition, which forms a perfectly rigid wall only 3 inches thick when plastered over on both sides. A wall so formed is fire-resisting and sound-preventing, also germ-proof, vermin-proof and damp-proof, and is self-supporting. In addition it is lighter than brickwork, being 500 per cent. lighter than a $4\frac{1}{2}$ brick wall. It can easily be erected by anyone. The ordinary lath-and-plaster construction of late years has been discarded in favour of better systems, owing to lack of solidity, non-resistance to fire, and many disadvantages in bringing about insanitary conditions. Hygienic block partition walls remedy all these evils. These improved partitions are built up of blocks or slabs preferably of about 6 feet 6 inches in length by 10 inches deep and 2 inches thick, and composed of a light fire-resisting material. Through the blocks or slabs are a series of longitudinal tubes, the said tubes forming continuous passages through the blocks or slabs when the latter are placed in position contiguous to one another. These tubes have the effect of deadening sounds between rooms provided with the said partitions, and they also

give lightness as well as rigidity to the blocks or slabs. The blocks are of such consistency that they can be cut with the greatest ease to any length that may be required with an ordinary saw. Where very great strength is needed, such requirements are provided for, but a slight additional weight is then included, which, however, is of little consequence, the cost in all cases being trivial compared to the cost of other systems. The finish of the walls with the Hygienic wall-plaster or fire-resisting cement results in perfect smoothness equal to that of marble-work. The blocks afford a fine key for plaster-work, as perfect as could be desired for any kind of plaster-coating. Some of the advantages possessed by this system have been already mentioned—strength combined with lightness of structure, sanitary properties, sound and fire-resisting capabilities, &c. It has been much used in theatres. In addition the partition is self-supporting, and enjoys immunity from any danger of cracking, there being no woodwork to shrink or expand through influence of weather. It is not only cheap in actual cost, but economical in saving of time. The Hygienic fireproof cement is a plastering material free from all efflorescence or salting, drying in a few hours and ready for painting, &c. It is an excellent cure for damp walls. An application of this system should be mentioned, viz. that it is peculiarly well suited for walls which it is desirable or necessary to fix tilework on, as it forms a splendid key. The material also lends itself admirably, without the need of fixing blocks for driving nails on which to hang pictures, &c.

H. J. & C. Major, Limited.

Messrs. H. J. & C. Major, Limited, of the Patent Tile Works, Bridgwater, Somersetshire, are well known for the excellent roofing tiles manufactured by them, and which have been awarded medals at exhibitions. A pretty little structure erected in the hall shows off to advantage various weatherproof roofing tiles, and among them Major's patent weatherproof double Roman-pattern roofing tiles (75 tiles to a square), and Major's patent weatherproof angular corrugated roofing tiles (87 tiles to a square), also Major's patent interlocking plain tiles of the Broseley type (450 tiles per square). The patent tiles above mentioned do not require nailing to keep them in place, nor pointing, "touching," or "bedding" to make a perfect roof. Various specimens of ordinary tiles, roofing, paving, malt-kiln oven, &c., are also shown, and bricks and brickyard goods generally.

Samuel Elliott.

Mr. Samuel Elliott, of Newbury, Berks, has a very fine exhibit of mouldings in all kinds of hard and soft woods, for dados, architraves, panelling, skirting, cornices, &c., dentil work and electric-wire casings, church seat ends and mouldings of every variety, plaque rails, newels, balusters, chimney-pieces and other fittings, and cabinet-work. The patent perfect simplex weather bar of casements and doors opening inwards is also shown. This is rather a meagre description of what is shown by Mr. Samuel Elliott, for it certainly requires an actual visit to properly appreciate the work. There is shown much beautiful woodwork as it has been carried out for decoration of restaurants, hotels, and other buildings in our large English towns and cities, to the satisfaction of everyone, being handsome, appropriate, and altogether pleasing in its effect.

John Grundy.

We described last week the exhibit of Mr. John Grundy, of Duncan Terrace, N., and Tyldesley. Mr. John Grundy is also showing an improved sanitary air-tight frame and cover for drains, &c. It is claimed for this inspection cover, known as the "Gough," that it is the most perfect, simple and economical manhole cover offered to the public, no screws or similar device being required as with other covers; warranted not to get fixed in the frames. There is no doubt a simple contrivance like this, which is gas and air-tight and opens readily without anything being out of order, even if the cover had been unopened for years, is a very valuable appliance. We hear that everything exhibited by Mr. John Grundy at his stand has been sold, and that several orders for the warm-air and ventilating apparatus have been booked.

Mintons, Limited.

In our notice of this exhibit last week we promised to give further particulars in this week's issue of *The Architect*, which we now proceed to do. The tiles of Messrs. Mintons, Limited, of 28 Walbrook, E.C., form an attractive feature of the exhibition, and the new designs in the arrangements for walls are worthy of the artistic reputation of this well-known house. One cannot help being struck with the excellence of their manufacture. Their coloured glazes, with plain surface, are worthy of special notice, being entirely free from crazing. This defect, so general with tiles of this class, and which is very noticeable in lighter colours, they appear to have quite overcome. Their ornamental panels, with a view of an old cottage

surrounded by strips and mouldings, is very pleasing. We noticed, too, a charming pair of panels for stoves in coloured glazed; the subject, a view with windmill, produced by embossment and indentation. Fender kerbs, the front lengths in one piece up to 4—6, are to be seen, and are much to be preferred to those in 12-inch lengths, there being no ugly joints to regulate. Altogether it is a grand collection of tiles, giving some idea of the vast number of patterns made by Minton's of Walbrook.

The Silent Step and Flooring Company.

The Silent Step and Flooring Company, of Leadenhall House, 101 Leadenhall Street, E.C., show their patent step and floorings for covering steps and surfaces of all kinds, whether in or out of doors. The steps and flooring consist of a steel sheet, effectually galvanised or enamelled to prevent rust, made in any size or shape, and pierced with a number of diamond-shaped or square holes, into which studs or blocks of the most durable indiarubber are inserted, which give firm foothold and render slipping and noise impossible. The studs or blocks of rubber being dovetailed into the metal frames, they cannot come out. The Silent Step and Flooring Company are manufacturers of the patent loose rubber stud. The stud consists of a small iron plate with projecting nail points, around which indiarubber is moulded and vulcanised, making a solid combination of rubber and iron. All that is required to fix the studs to the surface for which they are intended is a simple blow of a hammer. The studs so fixed will afford a firm and safe foothold, and are quite noiseless, cleanly and durable, and are suitable for staircases, billiard-rooms, refreshment-bars, door-mats, hansom-cab mats, tramcars, railway carriages, warehouses, aisles of churches, corridors, clubs, public buildings, &c., and companion-ways on board ship.

Freeman Brothers.

Messrs. Freeman Brothers, 99 York Road, Battersea, have a good display of sanitary specialties, which embraces their patent adjustable pedestal wash-down w.c. "Turret." The basin and trap are in two pieces of glazed earthenware, forming a complete pedestal closet of handsome design, the advantages of the arrangement being that the outgo of the trap can be turned in any direction relatively to the inlet to basin, and the whole apparatus maintains the full merit of a deep water-seal, attractive appearance, perfect security of jointing and easy application. For handiness in the setting system possesses many points worthy of notice, being easy to adjust. The closets

shown are all fitted with the firm's patent lead connections, which insure a perfectly tight joint. They also show an improved method of connecting lead to iron pipe, for these cast-iron casings are made in suitable lengths to form part of the conduit, and are cast with a bevelled aperture at the side. The cases are lined with lead turned over at the bottom and trafted into the collar at the other end, making the branch portion the strongest part of the work

William Hepton & Son.

Messrs. William Hepton & Son, of Hunslet Lane, Leeds, exhibit their new registered corrugated copper cylinders, which they have constructed with a view to securing cheapness with efficiency. It is well known in the trade the system of loading copper cylinders only reduces the price per pound, and the cost of an ordinary cylinder is more than Messrs. W. H. & S.'s corrugated ones, as they are sold at so much each to stand a definite pressure, and by specifying you save money and secure a pure copper cylinder to stand pressure required. The corrugated cylinders are finished with bright polished tops, and are guaranteed to stand double the pressure of any ordinary one same strength, and are as cheap as galvanised iron.

A. C. W. Hobman & Co.

Messrs. A. C. W. Hobman, Cliftonville, South Bermondsey, show specimens of their special tar-paving. It is made of pure limestone of a special description of stone, only found in their own Maidstone quarries. Specimens are shown of this tar-paving which have been standing the wear and tear of traffic for years in London. Throughout the entire thickness of the paving the stone is incorporated in the tar composition, and forms a homogeneous concrete slab suitable for vehicular and foot traffic. It has a nice smooth surface, pleasing in effect, and is not slippery. It keeps free from dust and slush, is impervious to moisture and is a sanitary pavement. For the Clifton artificial stone, artistic character, durability, cheapness and adaptability are claimed, and there seems no reason to doubt of its merits in these respects. Laid in slabs or *in situ* it is well suited for street-paving, railway platforms (especially where traffic is heavy), stables, brewhouses, warehouse floors, laundries, lavatories, cow-sheds and dairies, also for making sinks, chimneypieces, dressings of all kinds, steps, cills, heads, piers and caps, coping, ridging, &c. For staircases, plain or mosaic, it has been specified by London and provincial architects by Board schools, public and charitable institutions, public and private buildings generally. Old and worn staircases can be

levelled up and renovated with Clifton stone. It is non-slippery and worked with the same facility as natural stone. The Clifton mosaic stone is designed for decorative purposes, and made in various designs and colours, forming an excellent substitute for marble.

T. Potterton.

Mr. T. Potterton, 122 Cavendish Road, Balham, S.W., exhibits a remarkably good system for house warming which, though only a few months old, has attracted considerable attention, and is already much used. It is a system of warming buildings by utilising what would otherwise be wasted heat from kitchen fires. This is effected by an improved zigzag range-boiler. It can be fitted to any kitchen or range, and is so arranged that it has a maximum of heating surface which is heated by the waste heat. These boilers, which are very powerful, heat from 100 to 200 gallons of water per hour, and warm from 20,000 to 40,000 cubic feet of space, according to size of boiler, for they are, of course, made in various sizes to suit any existing range. One boiler fitted in a house and used during the winter for a 10-inch fire (42-inch kitchen) is now heating equal to 600 feet of 2-inch pipe in coils, warming seven rooms, a small greenhouse 10 feet by 9 feet by 6 feet, a small conservatory 8 feet by 10 feet by 4 feet 6 inches, a large window conservatory 16 feet by 4 feet by 2 feet, and gives an abundant supply of hot water for domestic purposes, the range being used for baking, roasting and boiling purposes. There is no other fire on these premises, and there were six before this system was installed! Anthracite coal can be used at night time, thus supplying the house all night with warmth, the anthracite burning ten hours without attention. Independently, a special boiler is made for heating greenhouses or other structures if so desired. Mr. Potterton also shows Milan's patent automatic fire-extinguisher for household boilers and heating apparatus, by the use of which disasters and loss of life caused by explosions of domestic boilers and heating apparatus is rendered absolutely impossible. The appliance is simple in construction and perfectly automatic in its action, there being no mechanism to get out of order, no valves to lift, or disc to break, nor springs to force, but simply a balance of pressure by a small quantity of mercury, and if the pressure is increased at all over the nominal water pressure on the boiler the appliance immediately acts, puts out the fire, relieves the pressure, and after the source of danger is removed the appliance immediately seals itself and is ready for acting again.

House Sanitation Company.

The House Sanitation Company, 15A Baker Street, W., show the "Kallio" metallic triple-jointed airtight cover for manhole chambers, the "Kallio" accessible iron gullies, the "Kallio" traps for scullery sinks, the "Kallio" brass scour-traps for lead-lined sinks, "Kallio" cone air-inlets, "Kallio" interchangeable stair-treads and "Kallio" fence spur-nail. The principle of the air-tight cover consists in the cover and frame having turned and ground bevelled faces, which are truly seated by a vertical guide joint, also a supplemental lute-joint filled with oil or soft soap, which acts as a lubricant to the faced joints. Thus a triplet of joints insure security against the escape of gas from inside the chamber, or penetration of water from the outside. In the accessible gully the trap dip is formed by means of a cast-iron bucket dropped into water; this is removable for cleansing purposes, and when taken out it displays an important feature, viz. the entrance (horizontal) to the drain-pipe is left clear so that the drain rods can easily be passed through the pipes, and any obstruction that might occur in or at any point in the drain is easily removed. The cone air-inlet has a narrow-coned neck to increase the velocity of fresh air through drains, and the smallness of the talc valve renders it more certain in its action of closing over the cone and thus preventing any return of foul air reversed by the discharge of water through the drains.

F. Willis & Astley.

Messrs. F. Willis & Astley, 34 Ely Place, Holborn Circus, E.C., show a fireproof and ventilating floor as the lightest, strongest, and most perfect ventilating system. This flooring is constructed with steel joists, concrete arches and terra-cotta lintels. The lintels are designed in such a manner that they completely encase and protect from fire the joists upon which they rest, and are so constructed as to form a continuous air chamber through the floor. Thin corrugated curved iron placed between the webs of the lintels serves as a permanent centering, and forms the concrete into arches springing from joist to joist, thereby gaining the advantages of great strength and extreme lightness; the bulb tops of the lintels being embedded in the concrete are by that means firmly fixed and held. The weight is carried by the joists and concrete only, the lintels simply serving as a fire-resisting covering protecting the metal and concrete, and forming a flat fire-clay ceiling, keyed to receive plaster; the entire space between the underside of the concrete arches and the flat ceiling being available

WORKS, ROTHERHAM. Estab. 1854

for the purpose of ventilation by means of circular holes cut through the ceiling. This chamber can be connected with the rooms below, and thus enable all foul air and smoke to be drawn away into flues formed in the walls, fresh air being admitted through gratings in the outer walls, thus a constantly changing current of air is allowed to circulate freely between the ceiling and the joists. Should a fire occur, the joists and concrete by this means are insulated from the heated ceiling of the rooms below. It is partly due to the circulation of air that it is claimed that the system is absolutely fireproof. The lintels are all fixed at right angles to the joists. They are easily cut and fitted to any irregular-shaped building, and can, if necessary, all be inserted after the joists are fixed, leaving no gaps whatever, and requiring no making up in any way with inferior material. Trimmer joists, and in many cases main girders, can be protected by the lintels (as shown in the longitudinal section) in a manner that is quite impossible with any other system. The minimum depth of the floor is 6 inches, and the dead weight is only 40 lbs. per foot super. The strength of the floor is simply dependent upon the joists used. Floors can be constructed to carry any weight desired. We understand that the whole of the fireproof floors in connection with Messrs. Lloyd's new premises are on the Willis & Astley system.

The Mechanical Inventions Syndicate, Limited,

of 4 Tokenhouse Buildings, E.C., show the "Eclipse" door-check and spring, a very ingenious and admirable invention for application to doors, as it does not get out of order or require attention. No one can slam the door if they try to do so; the door will close, but after its own sure and gentle method. It also allows the door to open full width. This handy little appliance should be inspected.

William Johnson.

Mr. William Johnson, Castleton Foundry, Armley, Leeds, exhibits a patent sanding apparatus for making stock-bricks, which can be attached to any ordinary pugmill, and which is largely used on the Continent, and with which two lads can turn out 10,000 stock-bricks per day. As the material issues from the pugmill sand is sprayed over it. Thus the combination pugmill brick and tile-making machine performs four processes of hoisting, crushing, pugging and moulding, and forms a complete plant in itself, fitted with a patent automatic sander and presser, which sands and presses the bricks as they

issue from the die of the machine. By the use of the Belgique friction power screw press all patterns and sizes of ornamental roofing tiles and similar goods can be pressed, and its principle, it will be seen, is applied to other machines shown for pressing purposes.

Dubois d'Enghien Brothers.

Mr. William Johnson also shows at his stand a new system of kiln, of which he has taken up the sole agency for England. A model of the kiln is exhibited. It is on an entirely new principle, and gives double the economy of fuel over the "Hoffman" type of kiln, and is adapted for burning all kinds of best goods, enamelled bricks and terra-cotta ware. The great economy in fuel over other existing continuous kilns also recommends it for burning ordinary bricks. It is also more simple to work than any other kiln. According to the model shown the kiln is fired from the bottom, and not from the top, and the bricks completely chambered off so that there is no possibility of admixture of dirt, cinders, &c., there being two lines of parallel chambers. Wood, peat, &c., can be used instead of coal if necessary, and another advantage is the large amount of drying space provided. Besides economy as to fuel the draught is equable throughout, the burning and cooling are effected gently and progressively, and the firing being from the bottom, no chimneys are necessary, filling is rendered easy, and delicate ware can be burnt and turned out. Heat can also be easily transmitted into upper floors for drying purposes. There seems to be no difficulty in any ordinary workman managing the operations. The same system, we understand, can be had for use as an intermittent kiln. This new kiln is evidently the more appreciated as it gets known. It was invented by Messrs. Dubois d'Enghien for the burning of bricks, tiles, pipes, paving tiles, fireclay goods, enamelled and glazed ware, earthenware, &c.

A. T. Cooper.

Mr. A. T. Cooper shows a most useful and efficient suction and vacuum pump. The article is really one that would prove useful in every house. It might be thought from its name that it is something cumbrous, while in reality a casual glance would reveal nothing more formidable, apparently, than a stick with a sucker or rubber disc attached to it, notwithstanding its great power. It is a special sanitary appliance for removing obstructions in closet traps, drains, soil pipes, baths, sinks, stack-pipes, &c.

OFFICE: 175 STRAND, LONDON, W.C.

John Whitehead & Co.

Messrs. John Whitehead & Co., Albert Works, Preston, Lancs., show their brickmaking machine No. 6, three-process, viz. for crushing the clay, pugging, and moulding it into bricks, and which can be made into four-process by addition of hauling gear; the machine has all Messrs. Whitehead & Co.'s latest improvements, adjustable roller bearings, &c., and is easily driven. Brick and tile-making accessories are also shown.

Francis & Co., Limited.

Messrs. Francis & Co., Limited, Bridge Foot, Vauxhall, Nine Elms Brand Portland Cement Works, show samples of cement manufactured and partially manufactured, and specimens of plaster, Keene's and Parian cements, also whitening; cement casks, and "Michele's patent" automatic cement-testing machine. This is a very interesting one to inspect, as it enables the visitor to see practically the constructional merits of the process and also various methods for decorative purposes. Specimens are shown which exemplify the adaptability of the manufactured material for construction of any kind of building and architectural work, including columns, arches, vaulting, &c., the solid work being composed of Thames ballast and cement in proportion of six to one. The samples of scagliola worked from Parian marbles into columns, &c., show what can be effected for ornamental and decorative purposes. Messrs. Francis & Co. have carried off prize medals at many international exhibitions in competition with home and foreign competitors. They justly claim that their "Nine Elms cements" have a reputation of some ninety years' standing, having been largely used in all manner of works requiring special strength and durability. The Company have carried out numerous works for Her Majesty's Government in this country and the empire generally, i.e. on which "the sun never sets"; for the late Metropolitan Board of Works, the County Council, for Docks and Harbour Boards, lighthouses, railways, waterworks, and numerous other miscellaneous public and private contracts, also for the French Government, for the United States, and South America, Japan, China, Turkey, &c.

Geo. Waller & Co.

Messrs. Geo. Waller & Co., Phoenix Engineering Works, Park Street, Southwark, and Stroud, Gloucestershire, have an exhibit that is well worthy of the attention of architects and builders. Their well-known specialties are shown and do not require describing, as our small space will only allow of

referring to one or two of the articles exhibited. What is new is Waller's patent hygienic air-tight and gas-tight cover, which should be inspected, as a well-designed appliance for hermetically sealing intercepting and inspection chambers, manholes, drain inlets, cesspits, grease traps, syphon tanks, &c., the aim having been to introduce the best principles of such covers without reproducing their defects. The door is secured by a cross-bar on the under side, the ends turn under the seating when tightened by the screw in centre of the door, making the joint perfectly air, gas and water tight. An air-tight cover and shoe combined, extensively used by London and provincial School Boards, has this extra advantage—that if for any reason the down pipe needs to be removed, there is no danger of breaking the socket, as so often happens with an earthenware shoe. Over ordinary safety gratings or side entrance covers, Waller's patent side entrance or manhole cover has a distinct advantage, being devised to meet the requirements of a cover that can be used as a ventilator, open or closed, whilst men are working below, not necessitating the attendance of a watchman to prevent accidents arising through passengers not noticing the obstruction. With regard to the cesspool pump, designed for sewage purposes, one that will not choke, Mr. E. R. Boulter reports to the Bexley Local Board on the first year's working that 367 cesspools were emptied, including 105 beyond the parish boundary. There was no difficulty in disposing of the material, and after allowing 20 per cent. for depreciation, there was a net profit of 150/ for the first year, and 200/ for the second year. A sunk street orderly bin is something of a novelty, and is decidedly an improvement on previous forms. It is largely used in various towns. The sunk bin offers no obstruction to the traffic, and is easily worked. One half the door is opened for filling the bin, and for emptying it the whole door is opened, one half folding down on the other; the galvanised pan is then lifted out and emptied into the cart. A model is exhibited of a patent concrete-mixer for steam or hand-power, showing the action of the apparatus and mixing of the concrete, being one of the cheapest of methods. Among penstocks is the improved circular penstock, and among tide-flaps is one that deserves attention, originally designed, and now largely used where sewers have little fall. An improved disc-flushing valve is characterised by the introduction of an improvement, one as simple as could be, and therefore the more effective and valuable. The valve is made more reliable by having two wedges instead of depending upon the hinge and

Electrical Novelty

TO ARCHITECTS, SURVEYORS, AND BUILDERS.

Call, or send for Representative to explain the NEW ELECTRIC CHAMELEON SIGN for FASCIAS, LANTERNS, LAMPS, and HOUSE SIGNS.

SOLE MAKERS—E. L. BERRY, HARRISON & CO.,
Electric Light Engineers, LYRIC CHAMBERS, WHITCOMB STREET, W.C.

Cases for Binding the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

pin at one side for keeping it tight. The lifting-rod is also jointed so as to occupy less room when the valve is full open. We can only in addition call attention to automatic check-valves for basements, preventing flooding from storm-water, &c.; to special kinds of gulley gratings, soil-pipes and branches, &c., which, however, are worthy of a detailed description.

C. G. Wood & Co.

Messrs. C. G. Wood & Co., of 104 High Holborn, W.C., are showing some very fine specimens of zinc-stamping, wrought-iron hinges, balustrades in wrought-iron and cast-zinc; also their great specialty, cast-zinc letters for advertising purposes, together with a complete dormer window in zinc. Their exhibits also consist of some very fine heads of lions in stamped zinc, zinc rain-water pipes and cistern heads, shoes, elbows, nozzles, &c.

T. Potter & Sons, Limited.

This firm's stand, No. 100, has a good exhibit of artistic and general iron and brass metal work, &c. Among their exhibits we specially notice their examples of wrought-iron. A small grille with lattice centre formed by being threaded through reversed joints and culminating at each corner with scrolls terminating with roses. A handsome staircase panel from the design of the late Mr. F. Cockerell, quaint handles, bell-pulls, fire-dogs, fire-irons, fenders, and last, but not least, the picture frames, which commend themselves to our notice as an exceptional artistic example of British workmanship, one being a cluster of roses, supported by lilies and small flowers; in the frame is an oil painting, the design and make of which, also the painting, were executed by the same man. The brass goods in this exhibit are on the same level as the iron, being splendid specimens of work and material, and consist of eagle and desk lecterns, candlesticks, crosses, vases and other church furniture, brass fenders, fire implements, stoves in iron and brass, iron mantelpieces, &c. With reference to stoves for heating infirmaries and other buildings, their thermohydric stove appears to be specially suitable; it is on the principle of a hot-water apparatus without the trouble, as the boiler is fitted in an ordinary open stove, and for large rooms is fitted in the centre of room with descending flues which are swept from the outside. They are very economical in consumption of fuel, and always give great satisfaction wherever supplied; they have been in use for sixteen years. The wrought-iron railings, gates, &c., for the Royal Courts of Justice, the Midland Goods Extension, St. Pancras, the famous riding school at Welbeck for the

Duke of Portland, and other large work on the estate, were executed by this firm, who also have just supplied one of their brass eagle lecterns, the celebrated Southwell pattern, to Lincoln Cathedral.

Charles Rees.

Mr. Charles Rees, of 203 St. John Street Road, E.C., has for his exhibit a display of metalised wood decoration for houses, ships' cabins, cornices, &c. We are informed that the process has already stood a trial of nearly ten years, with unvarying success, as applied to furniture, interior house and structural decorations, and that Mr. Rees can with great confidence recommend its use for high-class work, more especially when a thoroughly artistic effect is desired without special reference to the question of cost.

G. M. Beer.

Mr. G. M. Beer, Pancras Chambers, 90 and 91 Queen Street, Cheapside, E.C., shows his patent vulcanite cement roofing for rendering flat roofs available as gardens, playgrounds, drying-grounds, &c., and as a cheap, durable and advantageous material, also building felts and kindred materials. This cement roofing (Haeusler's patent) it is claimed has obtained a reputation for durability and economy, having been adopted with uniform success in Germany, Austria, Hungary, Russia, Italy, France, Algiers, Egypt, &c. It enables roofs to be made flat, insures dry and healthy garrets with an equal temperature, and is specially adapted for factories, warehouses, Government buildings, barracks, dwelling-houses, shops, &c. It is watertight, snowproof and fireproof, and extremely durable.

Samuel Wright & Son.

Messrs. Samuel Wright & Son, Crown Works, Amhurst Road, Hackney, show most excellent specimens of fibrous plaster decorations for ceilings and cornices, examples of fibrous plasters, columns, capital and basis; also samples of fibrous plaster slabs as supplied to ceilings and partitions for ordinary use, forming *in toto* a most effective exhibit.

Tangyes, Limited.

Messrs. Tangyes, Limited, 35 Queen Victoria Street, E.C., show one 7 horse-power nominal Tangyes' gas engine, indicating 16 horse-power and 13½ horse-power actual, Otto principle, Pinkney's patent, driving a dynamo for electric lighting of various stands. Also an assortment of jacks, westons and chain blocks, and other builders' lifting appliances.

LYCEUM THEATRE.

THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4½ brickwork partition walls. The thickness from face to face is only 3 inches, thus *saving enormously in weight and space.*

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

B. WARD & CO.,

15 GREAT GEORGE STREET, S.W.

CONCRETE STAIRCASES.

VOLUME L. OF THE ARCHITECT.

Handsomely bound in Cloth, Gilt Lettered.
 Price 12s. 6d.

Office: 175 Strand, London, W.C.

The Patent Victoria Stone Company, Limited.

This company, 283A Kingsland Road, N.E., have a handsome and representative collection of their well-known specialties on view at the Hall. The patent Victoria stone is used for every purpose that natural stone can be applied to, practically to numerous uses that natural stone cannot be applied to, as special varieties of natural stone would have to be selected to serve the many purposes that the Victoria stone is used for. In building it is used for steps, staircases, balustrading, window heads and sills, also for paving, for sinks, coping gully traps, &c., and for ornamental vases, &c.

Dartford Cement Company.

The Dartford Portland Cement Company, of Dartford, Kent, show Portland cement extremely finely ground. The whole of the cement turned out by this company is found to be very fine. When sifted through a sieve of 5,776 meshes to the square inch (known as a 76 mesh sieve), it leaves a residue of less than 5 per cent. or less than 1 per cent. residue on a 50 mesh sieve. This is considerably finer than cement supplied by most other makers. The residue, which consists of imperfectly ground particles of clinker, possesses, as is well known, absolutely no cementitious or binding properties whatever, and hence a cement that contains a large proportion of this "residue" is to all intents and purposes practically as much adulterated as if it contained so much sand. When, however, this "residue" is ground up, the actual volume of the cement is increased and its strength intensified. A larger proportion of sand or other ballast may be safely mixed with a cement ground as fine as that of the Dartford Portland Cement Company, and it is thus more economical to use and cheaper in the long run.

Norris & Henty.

Messrs. Norris & Henty, Limited, 235 Upper Thames Street, E.C., exhibit the "Robinson" hot-air engine and fan; "H. R." (Horace Robinson) gas-engine; Gardner dynamo and arc light; 4 h.-p. "H. R." gas-engine; "Robinson" hot-air engine with pump; one 3 h.-p. gas-engine; one 1 h.-p. gas-engine; one hot-air engine and pump combined; one small hot-air engine; one small dynamo and arc lamp. The "H. R." patent gas-engine marks a great advance in gas-engine design and practice. It is made either with or without self-

contained water tank, the engine bed itself forming the tank in the former case, both kinds being shown. The exhaust valve, which is the only machine-moved valve in the engine, is operated by an ordinary eccentric, thus not only doing away with the usual lay shaft, gearing, cams, &c., but also making it possible in a few minutes to reverse the direction of the engine's motion. The engine is particularly well adapted for electric lighting and other purposes in which a smooth action is a necessity. The impulses are given regularly, thus avoiding sudden jerks and negative actions, and insuring great evenness of speed. A new patent governor of very simple construction maintains a regular supply of gas, which is checked or augmented to the requirements of the engine, and admits of no waste. The speed of these engines can be varied in a few seconds while they are running, thus rendering them especially suitable for electric-light work. The smaller sizes may be safely run up to 250 revolutions per minute, at that speed rendering available for driving purposes upwards of 75 per cent. of their indicated horse-power, and consuming 20 cubic feet of gas per indicated horse-power.

T. C. Williams & Sons.

We described last week the exhibit of Messrs. J. C. Williams & Son, of London Street, Reading. "J. C. Williams & Son" should, however, have read "T. C. Williams & Sons." In addition to what was said last week of the beautiful fire ranges shown by this firm, we might add that strength, solidity and durability has been one of the chief aims in their manufacture. The ventilating radiators for hot water or steam-heating provide a large heating surface in small compass, and these can be made in any ornamental style desired, fitted and suited for many and various purposes.

Humpherson & Co.

Messrs. Humpherson & Co., sanitary engineers, Beaufort Works, 297 Fulham Road, S.W., show a variety of improved valve and pedestal closets, and the "Beaufort" flush-down basin and trap in various qualities, improved syphon cisterns, gullies of many kinds, and manhole covers for drains, a grease gully with air-tight cover, improved gully for sink waste pipes, &c., patent pipe joint for connecting soil pipes with closet traps, drain interceptors, patent and improved taps of many kinds, lavatories in various patterns.

DOWSON, TAYLOR & CO., LTD. LONDON: 14 Victoria St., S.W.
MANCHESTER: Blackfriars Bridge. And at GLASGOW and PARIS.

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

The Midland Glazed Brick Company, Limited.

This company show a wall of white glazed bricks, capped with a course of brown enamelled bricks. These bricks are of great durability, being made of a ferruginous clay, and glazed with a hard, imperishable enamel, well burnt in, and which will not craze, and it is difficult to chip. They are true in make and uniform in colour, and find a ready sale in London. Mr. T. Freeman, of Phoenix Street, does the whole of the company's business in London and the Home Counties.

Ellis, Partridge & Co.

Foremost amongst the chief displays of goods on show are this firm's tastefully decorated stands, upon which are exhibited a large variety of splendid specimens of their red bricks—rich in colour and absolutely true in make—viz. pressed facing bricks, moulded and ornamental goods, ventilating bricks, &c. A special feature of their exhibits is a large entablature for date, made and burnt in one piece, with rich moulded frame, entirely free from fire cracks, the one great difficulty which has to be overcome in the working of most red clays. The clay of which these goods are made is thoroughly weather-resisting, and being particularly adapted for this class of work, the most delicate patterns can be produced, and as shrinkage is especially uniform, complete accuracy in detail may be relied upon. This firm now take a leading position in supplying bricks for important public and private buildings in the Metropolis.

Marsden Tile Company.

The Marsden Tile Company show a very tasteful and elaborate variety of tiles forming dados and stove decorations of a high class. This company has made spirited progress of late years, some of their rich tints and judicious designs ranking with those of older and better known firms. We understand that Mr. Freeman, of Phoenix Street, Westminster, is interested in this exhibit.

MR. A. T. MACER, of Cheapside, has purchased from Messrs. Carey & Lewis their Crouch End and Hornsey business. He has also taken into partnership Mr. Edward Charles Fitzwilliam, M.A. Oxon., who will undertake the management of the Crouch End office.

PATENTS.

[This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.]

APPLICATIONS FOR PATENTS.

5091. Thomas Aston and Thomas Aston, jun., for "An improved water-tap."

5099. Walter Whitley, for "Improvements appertaining to sliding windows or sashes."

5152. John George Russell, for "Improvements in or relating to set squares."

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

LYCEUM THEATRE.
THE PATENT FIREPROOF & SOUNDPROOF PARTITIONS

HAVE BEEN EXECUTED BY

W. POUNTNEY, Sole Agent for London, and Contractor.

This Patent Partition is constructed of Blocks or Slabs of Plaster material, formed with a series of longitudinal Tubes of Fireproof Material to deaden sound, each block being keyed to the adjoining one by light Iron Clamps, the whole being afterwards plastered on either side, and forming a rigid soundproof and fireproof construction.

When finished, the weight is 64 lbs. to the square yard, against 280 lbs. to the yard in 4 brickwork partition walls. The thickness from face to face is only 3 inches, thus saving enormously in weight and space.

There is no contraction or expansion as in wood partitions. The system is so simple that the partition can be erected by any intelligent labourer, with one assistant, in half the time of ordinary brickwork. The price is very little more than ordinary brickwork.

W. POUNTNEY, 13 VICTORIA ST., WESTMINSTER, Sole Agent for London, and Contractor.

VARIETIES.

LORD ARMSTRONG has proposed to purchase Bamborough Castle, Northumberland, and to endow it as a convalescent home. As at present it is used for Lord Crewe's Charity, the consent of the High Court to the sale will be necessary.

AN offer of 5,000l. has been made to the Liverpool Corporation towards the establishment of a central School of Science, Technology and Art, on condition that equal or greater assistance be given by the Corporation.

THE trustees of the Harris Institute, Preston, having accepted a tender amounting to 13,000l. for erection of a technical school, although possessing only 10,000l., have appealed to the Town Council for the balance. The council have declined to grant the money.

MR. A. FOWELL BUXTON, having presented the London County Council with copies of the two figures found in Herculaneum, known as *The Wrestlers*, they have been set up in the Embankment Garden near the statue of the late John Stuart Mill.

PROVOST ORCHAR presided at the opening of the Dundee Graphic Arts Association. He said that what they wanted was not so much technical education in the shape of handicraft, but the cultivation of taste in art and colouring. From 40,000,000l. to 50,000,000l. a year was paid to Germany and France annually by this country for fancy articles, attractive on account of their design and colour.

AN exhibition has been held in Edinburgh of the work executed in the Edinburgh and Leith Plasterers' Technical School, which is supported by the trade with the aid of a grant by the Town Council. The pupils receive instruction free of charge. Freehand and architectural drawing and modelling are the subjects taught, and a considerable number of apprentices and young journeymen attend the classes.

THE east window of Coddensham Church, Suffolk, is now fitted with stained-glass. The three lights, which are very large, picture the Adoration of the Shepherds and the Magi. In the openings of the tracery are on one side the figure of St. Gabriel, and on the other side the figure of the Blessed Virgin, and in the centre a lily with a scroll bearing the word "Ave." The window is erected in memory of Sir Richard Wyles by his sons.

STAINED-GLASS now fills the east window of Mary Tavy Church. It is a three-light Perpendicular one, the stonework of which has been restored by Mr. Edmund Sedding. The subject illustrated runs through all the lights, and is under elaborate canopies of the period. It depicts a vision of our Lord in glory, surrounded by kings, bishops, men and women, indicating all states of the Church triumphant. Above the head of our Lord is held an elaborate crown, supported by two flying angels. The donor is the Rev. J. K. Anderson, vicar of the church.

THE Duke of Westminster presided at a meeting of subscribers to the Royal Alexandra Hospital, Rhyl, on Saturday, when it was resolved "That the secretary be instructed to obtain estimates for the carrying out of the work as soon as possible, and also that the building committee set to work at once in regard to building on the old site."

THE summer excursions of the London Geological Field Class on Saturday afternoons, under the direction of Professor H. G. Seeley, F.R.S., commence on the 21st inst., when the members visit Wanborough and Guildford. Particulars can be obtained from the Hon. Sec., Mr. R. Herbert Bentley, 31 Adolphus Road, Brownwood Park, N.

1a CRESCENT, MINORIES, LONDON, E.C.

NEGOTIATIONS are in progress for the construction of a pier, with landing-stage and pavilion, at Seaford, at an estimated cost of 12,000*l.*, and for another at Littlehampton, costing 10,000*l.*

THE church of South Ferriby, Lincolnshire, has just been enriched by the addition of a stained-glass window, in memory of the father, mother, brother and sister of Mr. James A. Veitch, of Harrogate, the donor. It is in three lights, that on the left illustrating the Presentation in the Temple, the centre light the Lord Blessing Little Children, and the right light the Baptism of our Lord. The whole is under canopies of fifteenth-century work. In the tracery are four Evangelists and the emblem of St. Andrew, which is the name of one of the memorialised persons. The arms of the family are also introduced.

MR. J. BADGER, the chairman of the Bromsgrove School of Art, is so well satisfied with the wrought-iron work produced by the local nailers in the classes that he proposes to form a limited liability company in order to utilise their ability.

A BILL has been introduced in Parliament to authorise the expenditure of 15,000*l.* out of the Sutors' Fund on improving the Law Library in Dublin, which is a danger to all who enter it.

AN arbitration was lately held in Leeds before Mr. Bidder, Q.C., to determine the value of a strip of land containing 835 square yards, required for the new post-office. The sum awarded is 5,225*l.*, or nearly 6*l.* 5*s.* a yard.

SIR JOHN STIRLING MAXWELL has presented the city of Glasgow with a piece of ground extending to about two acres in the district of Pollokshields, and in the vicinity of Titwood Parish Church.

THE report of the Board of Trade on the Railway, Canal, Tramway, Gas and Water Bills deposited for the Session of 1894 states that the total number of Bills relating to these subjects is 127, as compared with 134 in the Session of 1893, and the total amount of money 22,146,305*l.*, as compared with 30,063,670*l.* last year.

AT the meeting of the Salford Town Council it was resolved that early application should be made to the Local Government Board for power to amend the building regulations in force in the borough. Various members of the Council expressed the opinion that there was need for additional stringency in the matter, as buildings of a very undesirable character were being erected in various parts of the borough.

IN regard to the Inverness Gasworks arbitration, Mr. Murdo Paterson, C.E., has issued his decision. Mr. Roderick Fraser, the contractor for the excavation works of the new gasometer, made a claim of 626*l.* for extras, and the arbiter has now fixed the award at 599*l.* In case of Messrs. Newton, Chambers & Co., 164*l.* was allowed as extras, making the total amount paid, exclusive of expenses of arbitration proceedings under this heading, 763*l.* The gasometer itself, exclusive of the cost of the excavation works, was 6,180*l.*

AT a meeting held in Edinburgh under the auspices of the Edinburgh Merchants' Association, a resolution was adopted approving of the formation of a canal between the Firths of Forth and Clyde of sufficient depth and width for the largest vessels. It was decided to approach the Government with a view to its assistance in carrying out the project, and the meeting formed itself into a committee to further the scheme.

MR. SHAW LEFEVRE informed the House of Commons on Friday that it was hoped a beginning would be made with the new buildings at South Kensington next year. By the completion of a number of new and heavy works in the course of the present year, a sum of 60,000*l.* would be set free, so to speak, without substantially adding to the vote for public buildings next year. A sum of 4,500*l.* was asked for this year to provide temporary accommodation for the staff, who are employed in the "boilers," which will have to be cleared away to make room for the new buildings. Mr. Aston Webb's designs have been approved for the buildings.

TRADE NOTES.

THE whole of the stone carving of the Tower Bridge has been executed by Mr. C. H. Mabey, of Vauxhall Bridge Road, S.W., and also the models for the ornamental ironwork.

WE understand that the Red Star Glass Works Company, Marchienne-au-Pont, Belgium, have nominated Messrs. Corfield-Smith & Co., 9 Billiter Square, London, E.C., as sole agents in the United Kingdom for the sale of their well-known "Red Star" brand of window-glass.

THE foundation stone of the enlargement of St. Mary's Church, Woolwich, Mr. J. O. Scott, Architect, will be laid tomorrow (Saturday) by Lord Roberts. St. Aldhelm box ground stone is used for outside and Farleigh Down for interior, from the quarries of the Bath Stone Firms, Limited, Bath.

THE WESTMINSTER PATENT FLOORING COMPANY.

THIS enterprising company have just opened new show-rooms at 73C Queen Victoria Street, premises in close proximity to the Mansion House Railway Station, most conveniently situated, being readily accessible from any part of the Metropolis and for all visitors to town, an advantage which will be appreciated by the general public, who can thus inspect for themselves these varied styles of floors which their architects have recommended for use. The company are contractors not only to H.M. Government, but to many corporations, school boards, guardians, vestries, county councils, &c. A line will suffice to speak of the company as manufacturers of patent block, parquet and mosaic floors. An inspection of the show-rooms will, however, be sufficient to prove that a very large amount of space could be filled with descriptive matter, and yet a great part of what might be written would have to be omitted. The following remarks must therefore be taken as suggestive, and not entirely as a detailed description. Some of the varieties of flooring may be particularised as follows:—The patent "disc-key" block (with patent expansion joints), the cheap ordinary block; solid parquet (1 inch thick) for new houses and better class work, and thin carpet parquet ($\frac{1}{4}$ -inch thick), for covering old, worn and uneven or shrunken floors; hardwood long floors (special tongued and grooved); wooden gratings, for hot-water pipe trenches; trench covers (in block); mosaic marble flooring, Granito, Venetian Trazzo and Roman; mosaic ceramic, and wood block and creosoted paving for yards, roads, stables, &c.

The accompanying engravings illustrate the patent disc-key block floor. The company are able, we understand, to provide this floor at a more reduced price even than before. A fuller description, however, will be of interest in connection with the engravings, showing the patent disc-key block floor, including expansion joints, with concrete fixing blocks and patent expansion joints to prevent floor rising, being guaranteed against defects as the soundest and best floor for standing true on surface, and cheap in manufacture and laying. The blocks are grooved along the side, and two "disc-keys," AA, are placed in the corners of each block as shown on illustration, thus bonding it to six other blocks and binding the whole floor together into one compact piece. At the time the concrete is laid rows of dovetailed bonding blocks (4 inches by 4 inches by $2\frac{3}{4}$ inches) are fixed at intervals of about one yard, and iron nails are driven into them and attached to special "disc-keys" BB,

which tie the blocks firmly to the sub-structure. These nails do not show on the surface, and thus any unsightly holes, plugs or wafers are avoided. (*See engraving.*) The bonding blocks to hold the nails are made of specially prepared tough concrete, which, unlike wood, will not shrink, decay or burn, and to which the cement concrete bed perfectly adheres. After a short time the nails hold tighter and firmer in this material than in wood. The discs are of galvanised iron, and being less than 1-16th inch thick, the blocks are not materially cut away. A thinner floor may, consequently, be laid, which is a considerable saving in expensive hardwoods. The blocks are laid in a strong asphalte mastic, which preserves the wood and forms an adhesive joint between the pieces and in the dovetailed grooves. For heavy traffic, floors of foreign prepared blocks, similar to those laid in Board Schools, laid in the ordinary manner are frequently considered preferable. The blocks are hard and will wear well. The price being naturally lower, floors laid on "disc-key" system are recommended for superiority both in appearance and firmness. Looseness or unevenness of the blocks after they are planed is prevented. The patent expansion joints (*see engraving*) are introduced to prevent the rising and blowing up of dry parquet and block floors when subjected to the damp of newly constructed houses. The spreading of a large floor is considerable if of dry wood. Frequently sufficient time cannot be allowed to dry the concrete and walls. Washing and wet traffic also cause swelling and subsequent shrinkage, and the expansion joint is designed to meet this difficulty. The mastic asphalte being slightly elastic, play is then allowed to any movement of the wood.

The advantages of the thin carpet parquet $\frac{1}{4}$ inch thick do not require enlarging on. Special attention should be called to the wooden perforated gratings for hot-water pipe trenches, which are peculiarly well suited for churches and public buildings, &c., instead of iron gratings, which are slippery and disagreeable to walk on, these wooden gratings being very ornamental in effect. Trench covers formed of the patent disc-key blocks are also used extensively, and among other bodies by the London County Council for their weights and measures stations. There is a movable trap arranged, and the cover can be removed easily without sliding and again replaced. Radiators above the floor distribute the heat, the pipes being below in the trench. Besides hot-water pipes the trenches are serviceable to carry electric casings, water and gas pipes. The hard-wood long floors for covering old floors is tongued and grooved in a peculiar way, so no conditions can prevent the formation of a

LORDSHIP LANE HALL, S.E.

NATIONAL BUILDING TRADES EXHIBITION.

THE exhibition closed on Saturday night, much success having attended it throughout. The following notices will conclude our description of the exhibits :—

Höfler, Raum & Co.

The collection of enamelled terra-cotta produced by M. Alfred Brault, jun., for whom MM. Höfler, Raum & Co., of 25 Bartlett's Buildings, are the sole representatives in Great Britain, was not only fascinating, but revealed a class of decorative work that increases the available resources of all artist-architects. The house of Brault has been long associated with French art, and in the course of years invaluable models have been amassed. The examples shown might be considered as tests of the most difficult class. A chimneypiece was French Renaissance in style. It was in brown and bronze green, on an ivory ground—an arrangement that was effective. The sides showed caryatids with satyrs' heads. At the back was an alternate arrangement of small enamelled plaques, with others bearing heraldic escutcheons. A series of panels of the frieze of *Archers* from the palace of Darius at Persepolis was a masterpiece. It was a full-size reproduction of the famous work in the Louvre, which was secured for France by M. and Madame Dieulafoy. As the original is probably as brilliant to-day as it was three thousand years ago, it testifies to the durability of enamels. The copy faithfully realised the style of the ancient frieze, which is a model of architectural decoration in its simplicity, vigour and effectiveness. Two life-size figures from statues by Allegrain and Canova were remarkable, as each was produced as a single piece. The graceful contours lost nothing in the process. Among other decorative works may be mentioned a pair of lions, which were one-half life size, and adapted for the decoration of stairs, landings, &c., pilasters,

newels, friezes, vases, masks, gargoyles, &c, all being in excellent style, refined in detail and exceedingly moderate in price. The entrance and exit of the stall were provided with balusters, which were excellent in design and colour, suggesting another class of production. There was also an admirable collection of wrought-iron panels, dogs and brackets, as well as specimens of the beautiful "Skytogen," which by its quality and the good taste of the ornament has secured the admiration of hypercritical judges. This leather paper has qualities that will excite the envy of the Japanese. The stall of Messrs. Höfler, Raum & Co. is not likely to be forgotten by any architect who studied it, and we look forward with interest to the appearance of the firm in next year's exhibition, for they are not the men who will be satisfied with a single victory. We recommend all architects who were unable to visit the Agricultural Hall to have a look at the showrooms of the firm.

Yates, Haywood & Co.

We give an illustration of one of the special exhibits that was shown, viz. the patent "Quadrant" kitchener, with lifting fire and open or close arrangement. The fire is self-adjusting, raised or lowered to any point by one hand, without any rack-work, for it works on the quadrant which is at back. One shown was a double-oven kitchen range, strong and well fitted

with continuous plate shelf, high oven in strong cast-iron, low oven in wrought-iron, strongly protected by cast-iron saddles, ovens ventilated by steam outlet pipes, bright banjo latch and hinges, bright bracket tables under ovens, wrought fall bar, with

draw-out fret and rack, swing smoke plate, with coves, ashes pan and cinder sifter, castings rubbed, hot plate ground and blacked, and fitted of course with the patent self-adjusting quadrant lifting fire. One of the most useful of ranges—for the special purpose for which it was designed—was shown by this firm, viz. the Guinness patented self-setter range. It is used in the Guinness blocks of workmen's dwellings, the Peabody artisans' dwellings, &c. The object was, we believe, to furnish a range that would minimise the rough usage that ranges are likely to suffer under the circumstances for which these are supplied. One particular feature of the range is a draw-out oven. Thus when the oven is pulled out the least experienced person cannot help but clean the flues, which are then entirely open to view. The range can be taken almost entirely to pieces piecemeal, and therefore there is little expense in supplying a new piece in any case of damage having occurred, or repair being necessary. The range being self-setting is another great advantage. In regard to the Columbia Road buildings, Mr. Mervyn Macartney, the architect, wrote to Messrs. Yates, Haywood & Co. as follows:—"I am glad to bear testimony to the excellence of the Guinness range, which has quite got over our difficulty of smoky chimneys. It is an economical, strongly made range, and its patent lift-out oven makes it very easy to clean the flues. It is altogether an excellent range for small and poor families." And the secretary, Mr. John Pilkington, writes:—"I used your Guinness range for the above building, and am so satisfied with them that I purpose specifying them again for similar work in the future."

Charles Davis.

Mr. Charles Davis exhibited some of the high-class blinds and fittings for which the firm has so great a reputation, the work being of no common or ordinary description, high-class work being only undertaken. Mr. Charles Davis makes a specialty of his outside improved Spanish blinds, as well as of duchess lace-blinds of the newest designs and patterns, and the highest class venetians with the latest patent actions, cane and wire blinds, Japanese screens, &c. The firm's patent brass railway grooving laths and cornice poles are generally adopted by the trade and specified by the leading architects. The exhibit, however, conveys but a slight idea of the large business of the firm. A comprehensive illustrated price-list issued by Mr. Davis should be consulted to judge of the great variety of beautiful designs. Architects, builders and the trade will find

in them many useful ideas for exterior decoration. The works and offices are at 40 Castle Street East, Oxford Street, W.

Thomas C. Fawcett.

Mr. Thomas C. Fawcett, Whitehouse Engineering Works, Hunslet Road, Leeds, exhibited at work the Jubilee power brick moulding machine (Breething & Fawcett's patent) for making sand-faced bricks. This machine will make 12,000 to 15,000 (by double delivery), or 6,000 to 8,000 (by single delivery) perfect sand-faced bricks per day, free from sand flaws or air bubbles; in fact, a perfect solid brick, either best facings or common clamp stocks, and as the bricks are moulded much stiffer than by hand, they are not put out of shape by wheeling to hacks or drying floor, and one-third the usual drying ground is saved. It will mould any clay that can be moulded by hand, either light loam or the strongest clay. It is fitted with patent automatic sander, and effects a great saving in sand and labour. No wires are used, and the power to drive is little more than to drive an ordinary pugmill. The pugmill can be made to work either horizontal or vertical.

The Metal and General Agency.

Messrs. Weager & Funk, 1 Whittington Avenue, London, E.C., showed a nice selection of variously designed wrought-iron stamped railing heads of best material and finish. These can be manufactured in all sizes and in any pattern. Wrought-iron stamped spanners were also shown, unfinished, finished and case-hardened.

J. Williamson & Co.

In our notice last week it was stated that the No. 513 Graphie stove, when lighted in the hall, showed an average oven temperature of 210 deg. Fahr. all the afternoon and evening. This temperature applied when it was an open fire, for when it is closed the temperature would easily increase to 350 deg. or more.

Aspinall's Enamel Company, Limited.

The Aspinall's Enamel Company, Limited, New Cross, S.E., had a very imposing and well-arranged exhibit, showing the merits—among other specialties—of their new washable water paint, "Wapicti." The claims for superiority made for this paint over others are:—It is durable as oil paint, at one-third the cost; that it produces a better surface than oil-flatted paint; that it is a disinfectant and antiseptic equal to carbolic sheet, without the offensive smell. No disease is possible

where walls are treated with Wapicti. Rooms may be Wapicti'd one day and inhabited the next without any inconvenient smell, so that for ease of application and rapidity of work Wapicti leaves nothing to be desired. To set out pictures or wall ornaments it is essential to have a soft deep background, and Wapicti renders this in perfection.

Majewski & Bayenbach.

An interesting novelty was shown at Stand No. 153 in the Central Avenue. The samples displayed represented the latest and most successful attempt to harden gypsum or alabaster, so as to render it an efficient substitute for marble. This Messrs. Majewski & Bayenbach are now producing in a material indistinguishable from real marble, as hard, as durable, and as beautiful. The veins are those of the natural gypsum, continuous throughout the entire mass. Owing to the infinite variety of markings found in the gypsum almost any pattern, from the boldest to the most delicate, can be obtained; and by the inventors' process almost any colours can be imparted to the material. On account of its cheapness it can be used in the place of wood, paper, stucco, plaster, &c., as well as for most of the purposes for which marble has hitherto been employed.

R. & J. Dick.

Dick's patent gutta-percha, canvas and Balata belting was shown at Stand 88, and is characterised by uniformity of strength throughout, durability, &c. In addition to their other excellent qualities, most gratifying results have been obtained from Dick's belts as regards retention of strength. It has been proved that belts which have been running for over eight years not only retain their original strength, but show not the slightest signs of wear and tear.

Robert Fox,

at Stand 48, showed a model of portion of the dome roof of the Gresham Life Assurance Company's Office, Poultry, London, showing Fox's system of copper tiling, which also illustrates the large dome roof of the Stock Exchange.

J. B. Stone & Co.

showed woodworking machinery, as agents for the Fox Machine Company. The universal mitreing machine, the Fox patent trimmer, &c.

Babcock & Wilson, Limited,

at Stand 128, had a model of their water-tube safety steam-boiler, now in use to the extent of over 1,500,000 horse-power, for all steam-raising purposes, used for steam-heating, cooking, electric lighting, &c., in public institutions and private residences.

J. H. Sankey

exhibited improved gulleys and interceptors. A perforated bucket of galvanised iron intercepts and collects small stones, dirt, &c. This can be taken out and emptied, removing grease from gully.

Wm. Gibbin & Son

showed at Stand 98 draught-excluding sliding sashes in solid frames.

Workmen's Competition.

In the competition open to artisans of various trades, held on Friday evening, the most valuable class of medal was awarded to Mr. H. Hunt, who is in the employ of Mr. John Grundy, the well-known heating and ventilating engineer, whose exhibit at the Agricultural Hall proved so interesting to visitors and so lucrative to the exhibitor. The judges were Messrs. F. B. Dashwood, secretary of Clerks of Works Association; W. G. Drew, Adrian Hovydonk, J. Parker, of Birmingham; Walter Payne, of Bristol; Fred Tibbitts, of Birmingham; and Samuel Wright, of Hackney. The following is the list of awards given:—Bricklaying—C. Greenaway, H. Hunt, H. Allen, silver medals; Carpentry—T. J. Tripp, bronze medal; Plumbers—H. G. Mankin, silver medal; Plasterers—T. White and G. Jupp, silver medals; Tile Fixing—C. Vaughan, bronze medal; H. Lambert and E. Sutton, silver medals.

Among exhibits by other exhibitors, the Cyanite Paint Company showed samples of combined fireproof and damp-proof paints; Mr. C. Gray Hill, of Coventry, roofing tiles, bricks, finials, &c.; Mr. W. A. Burr, tubular ceiling in terracotta; Messrs. Hicks, Gardener & Co., bricks, tiles, &c.; Mr. Sydney Butler, woodworking machinery; Mr. Walter Dunn, ornamental doors and tables; Messrs. Gray & Batstone, improved window-frames and sashes; the Rosemary Hill Brick and Tile Company, roofing tiles; Mr. F. E. Clotton, peat-dust dry closets; Messrs. Kirk & Dickinson, window-sashes, Murray's brickmaking machinery.

A presentation was made to Miss Clausen on Friday evening, the 30th ult., in recognition of her kind services and the evenings rendered so pleasant by the presence of her company, the Pompadour Band. The following letter, signed by the committee, as below, was addressed to Miss Clausen:—

"A committee has been formed, consisting of the under-mentioned, to express on behalf of the exhibitors their sincere thanks to you and all the members of your able and brilliant company for the pleasure your charmingly-rendered music has afforded us every evening during the exhibition. Whilst greatly appreciating the whole of your varied programmes, we have specially enjoyed the national melodies; and if not presuming too much on your kindness, we venture to suggest, before the close of the exhibition, that a selection of English, Scotch and Irish airs would be particularly appreciated."

This exhibition compares favourably with previous ones, for in nearly every case the exhibits were in order, or nearly, on the opening day. During the exhibition it was possible to visit the various stands and find someone to explain the specialties displayed, though, of course, in some few cases, no one could be found to give information to visitors.

PUBLIC BUILDINGS (LONDON) BILL.

In a memorandum which has been issued with the Public Buildings (London) Bill it is stated that London local authorities, with three exceptions, have not now the power to purchase land for their public buildings, except by agreement. Two exceptions are the School Board and the Asylums Board, who can purchase compulsorily under the Lands Clauses Act, after public inquiry and obtaining the consent of the Local Government Board, who make a provisional order, which has to be confirmed by Parliament. Under the recent Act "parish councils" are given this power, and every local board also has it under the Public Health Act, 1875, and in one case in London (Woolwich parish) where the Public Health Act applies. To avoid the delay and expense caused by the want of this power for all other London local authorities this Bill provides that public buildings erected out of rates may be built in the most central and commanding position necessary for the convenience and architectural adornment of the locality on freehold land.

EXTRAS IN BUILDING.

THE case *Lintott v. Holloway* has been decided in the Brighton County Court. The plaintiff, a builder, claimed 38*l.* 3*s.* 4*d.*, balance of account for work done, defendant putting in a counter-claim for 5*l.* 1*s.* 9*d.*, and having paid 25*l.* into court. Plaintiff had contracted to build a stable for defendant for 285*l.*, off which 280*l.* had been paid, leaving 5*l.* due. Some additional work was done, for which 43*l.* 13*s.* 4*d.* was charged, but off this 10*l.* 10*s.* had been allowed for bricks and other materials supplied by defendant. The account was disputed and surveyors were called in by both parties, and the matter referred to the arbitration of Mr. Blaber, who awarded 34*l.* 1*s.* 6*d.* as a fair amount to be charged. This proving unsatisfactory, the dispute was brought before the court, and several witnesses were called on both sides to speak as to the value and quality of the extra work done, Mr. S. Denman, architect, valuing the extra work at 21*l.* 19*s.* 9*d.* as against 43*l.* 13*s.* 4*d.* charged, and Mr. Carden appraising it at 31*l.*, whilst other witnesses put intermediate values upon the work. There was a clause in the original agreement that 5*l.* should be withheld until Mr. Holloway had expressed his satisfaction at the work, or his surveyor had certified that the work had been completed. It was admitted that Mr. Denman (Mr. Holloway's surveyor) had written and signed a certificate that the work was completed, but it did not pass into Mr. Lintott's possession; and counsel for defendant contended that consequently plaintiff was not yet entitled to the 5*l.*, plaintiff's solicitor maintaining that the terms of the agreement did not necessitate the passing of the certificate to plaintiff, providing it was signed. His Honour disallowed the 5*l.*, as the certificate had not been given to plaintiff, but gave him a verdict for 39*l.* 11*s.* 6*d.*, less the 10*l.* 10*s.* agreed to be deducted for the materials supplied by defendant.

THE Glasgow Institute of Architects have appointed Messrs. David Thomson and John Gordon, on the suggestion of the Glasgow Master Wrights' Association, delegates with full powers for the revision of the rules for the measurement of wrightwork, and it was agreed that the Institute of Measurers should be invited to send an equal representation, in order, if possible, to secure the adoption of a uniform system of measuring wrightwork, and thereby remove the occasion of much needless disputing between parties, and promote harmony and good feeling among all concerned.

RATING GROUND VALUES.

AT the meeting of the members of the Surveyors' Institute, held on Monday, there was a discussion on the paper read at the previous meeting by Mr. Howard Martin upon the report of the Local Government Taxation Committee of the London Council on the rating of ground values. Mr. Martin urged that the scheme was not one to take off the superfluity of large landowners for the relief of the poor occupying ratepayer, but to lay an extra tax upon the shoulders of everyone who owned a freehold, from the occupying owner of a "weekly" cottage or a 15-foot plot of land upwards. No doubt any proposal to tax income from all investments would meet with opposition from everyone who was thrifty or fortunate enough to have any investments at all, and in his judgment such a tax in any form was inexpedient, because it seemed desirable to encourage thriftiness and not to fine it. If such a course was really necessary it would be a wiser thing for our rulers to face the difficulty than to make use of the popular error as to the ownership and burdens of real property as a motive power to carry a measure which would be a direct injustice and hardship to many, and in the end would injuriously affect the prosperity of all. Mr. Charles Harrison, the vice-chairman of the London County Council, contended that the paper had been written under a misapprehension as to what had been or was proposed to be done by the Council. The drafting of the scheme must rest with the Government of the day, and the sole object of the Council was to arrive at a solution of the question, not from any political aspect, but as a social and economical matter. Certain broad propositions had been laid down by the Council for the consideration of the Government, and it was for the Government to settle whether these propositions were acceptable or not. The largest ground landlords in London, he mentioned in passing, were the Ecclesiastical Commissioners, and the annual amount of the rents for the land held by them was 320,000*l.*, a figure which was every year increasing. Mr. Harrison detailed at length the proposals of the Council, and dealt exhaustively with the contract question in connection with ground values. Mr. George Beken, Mr. J. R. Adams, Mr. F. Marshall, Q.C., and other speakers joined in the further discussion which ensued, and at its conclusion Mr. Martin was thanked for his paper.

A TOWN HALL, which cost about 12,000*l.*, has been opened in Newry. It was designed by Mr. W. Batt, of Belfast.

SOME POINTS ON BUILDING.*

IN taking this as a subject for a paper I do not intend to go into any of the many points on which I may touch with any degree of elaborateness from a scientific point of view, but merely the most salient from a constructional point, and on which so much depends sometimes—yes, often success or failure.

In proceeding, let us suppose we are going over the requirements of the ordinary everyday building. By this I mean one with which we are all familiar. We are consulted as to a building on a certain lot or site; its purpose is named. Consider well the surroundings (if of a permanent nature), the style of design best fitted for the requirements of the proposed building, and no matter for what purpose, let it speak for itself as far as practicable. By this I mean let your design give the ordinary passer-by an idea of its use—not by gingerbread ornament and signs, but by character and treatment. Let a "wholesale" be a plain, heavy, substantial-looking building; a bank a massive building of refined treatment; a school plain and substantial; a collegiate college or other public building Classic or of Classic feeling, plain, neat and substantial; the public building, with broad and lofty open portal or other entrance, simple in treatment and decoration. And, above all, let a church be a church, a model of perfection, perfect in every detail, and without sham.

All this you will say is a matter of cost, and seldom to be realised. Admitted to some extent it is, but work and advise to that end, and if then it cannot be got, do the best you can, always bearing in mind that what you do must be substantial, even if perfectly plain, and if this cannot be done with credit to yourself, better have nothing to do with it. But in most cases you can advise and prevail that more money be put in it, or the building cut down so that it may be fairly well done for the amount available.

Your design being satisfactory, see that the foundation is good—if not the rock—that your footings are good, of large stone flags and cement, piles and steel beams if necessary. The drainage being properly provided for from a sanitary standpoint, see that it is so put in, first that the intended grade and no more is taken out, or if by chance it should, that it is made

* A paper by Mr. J. Power, read at the fifth annual Convention of the Ontario Association of Architects, and published in the *Canadian Architect*.

up with broken stone. Do not depend on earth, even if tamped in. Next see that the pipes to be used are of the best salt glazed and without blemish, laid with tarred rope of sufficient size to just fill the space or difference in size between pipe and fosset, tamped well up to the shoulder of fosset. Throw your level over them to be positive that there are no low spots; then have them well blocked under with stone, to prevent rolling. They may now be cemented. Try an occasional joint by passing your knife into the cement, to know that the rope has been tamped well to the shoulder of the fosset and be most particular that they are cemented all round, especial attention being given to the under side, and if satisfactory they are now ready for filling, which, however, should not be done until the cement is dry; then fill carefully with clay well rammed to the top of the pipes.

The masonry is probably the next to require our special attention, as too many, especially when building coursing or ashlar, will give you two very poor walls where but one is required by building up the face to as much as 2 feet before backing it up and bonding over. This should not be allowed for at most more than 1 foot, and then it should be well bonded.

See that all joists have $4\frac{1}{2}$ bearing, and are cut back that not more than two inches are in the wall at top edge.

When partitions are over one another, let the studs of the upper come down on the head of the lower and thus save settlement by shrinkage of joists and breakage or cracking of plaster in angles, to some extent. Where partitions meet walls have first stud well spiked to walls.

I will now pass on to the question of plumbing, one I need hardly state of the most important to the profession to-day. In laying down your system avoid placing the pipes against outside walls, burying them in cement or behind plaster as far as possible. The soil-pipe or drain should be of medium iron, well coated inside and out, with brass cleaners, whereby to remove any chance stoppage which might take place by the introduction of foreign matter, for such things will occur, even under the best of management. Introduce fresh air, if trap can be got 12 or more feet from building, or where there are no windows over, and run pipe through and well above roof, enlarged to prevent stoppage by hoar frost. Before fixtures are set have openings plugged and system tested by filling with water. Vent all traps with pipe of same size into standing vent. Have all fixture connections made with brass and rubber, and all lead joints properly wiped and gasketed, funnels run and

caulked to cast pipes. After fixtures are set, subject the whole system to a second test of either smoke or oil of peppermint. In short, have it done in the best possible way; put in no more than what is really necessary and can be done in a thoroughly sanitary and substantial way.

LIBELLING BUILDERS.

A MEETING of the Glasgow City District Lunacy Board was held on Friday last. Among the subjects considered was a letter from Messrs. James Heibertson & Sons, contractors for the joinerwork at Gartloch, calling attention to a statement made by Mr. Blair at the preceding meeting of the Board, to the effect that all the work being done at Gartloch was unsatisfactory, and that it was a weekly occurrence to reject material and object to work. Although not named by Mr. Blair, still they were certainly included in this sweeping assertion, and, so far as they were concerned, the statement was quite untrue, and they considered it only due to themselves to ask the Board to get Mr. Blair either to confirm the statement as regarded them or to withdraw and apologise. In the event of neither of these courses being adopted, it would remain with them to take whatever steps they considered necessary in the circumstances.

Mr. M'Kenzie moved that the Board should take no notice of the letter. He considered that, as a public representative, he was entitled to fairly criticise any work in connection with the undertaking; otherwise his usefulness as a member of the Board would be destroyed, and it would be a great detriment to the public interest.

Mr. Campbell seconded the motion. He thought that Mr. Blair was not only entitled to make the observations, but the Board was entitled to protect him. If the Messrs. Herbertson thought that they had any claim against Mr. Blair or any member of the Board for anything said at the Board, it was for them to take what action they thought proper, and the Board had nothing whatever to do with that.

Mr. Bowman said he thought Mr. Blair would be acting wisely if he apologised for perhaps having hastily said things he ought not to have said.

Dr. Chalmers remarked that Mr. Bowman had taken up an erroneous position. He did not think Mr. Blair had said anything against the Messrs. Herbertson. Mr. Blair was there to protect the public, and he did not see why the Board should not uphold him.

CONTRACTS.

THE LONDON GUARANTEE & ACCIDENT COMPANY (Limited) issue Bonds as security on behalf of Contractors or Builders for the due performance of Government, Municipal, or other Contracts of every description at moderate rates. Office, 61 Moorgate Street, London, E.C. The Bonds of this Company are accepted by the several Government Departments.

Mr. Mitchell suggested that the matter should be allowed to drop. He thought Mr. Blair had only acted as any other member of the Board might have been expected to have done.

The Chairman asked if there was any other specific motion.

Mr. Bowman: No; I do not think it is a matter for us to interfere with. But I think Mr. Blair's remarks were far beyond fair criticism, and Mr. Herbertson or any other tradesman was quite entitled to call upon him to make an apology for the language he used. We are here to criticise, but let us do it in a fair and legitimate way, and not denounce tradesmen as rogues and vagabonds, which it was equivalent to.

Mr. M'Kenzie: Do not make these statements, because you are not stating what is true. I have here the extract which is quoted in the letter of Messrs. Herbertson, and upon which they found their charge. The extract is as follows:—"Mr. Blair called attention to the manner in which the work was being done at Gartloch. He said the master of works had very frequently to reject materials and object to certain work, and he thought the master of works' journal should be brought before the Board at every meeting, that the members might see how the work was being carried out." You see he did not make the statement that they were rogues and vagabonds.

Mr. Bowman: I did not state that he said they were rogues and vagabonds. I said it was an equivalent.

Mr. M'Kenzie: Well, what is the difference?

Mr. Bowman: A man that commits fraud is a rogue and vagabond. Is that not an accusation of fraud to have to reject materials? Mr. Blair had no right to apply it to tradesmen without founding on something specific, which I asked him to do again and again, but which he has not done yet.

Mr. Ogilvie said he thought that the letter should be acknowledged as a matter of courtesy, and that it should be added that the Board had the utmost confidence and satisfaction in the work done by the firm.

The Chairman suggested that the clerk might reply that the Board had no control over the individual expressions of opinion of any of the members.

Mr. Bowman: That is so. We do not endorse the statements of Mr. Blair.

The matter then dropped, it being understood that Mr. M'Kenzie's motion that the letter be laid on the table and a reply sent simply to that effect, was agreed to.

Mr. Blair, at a later stage, moved that the clerk of works' journal should be submitted regularly to the Board meetings. He observed that it would be intolerable if those who devoted

time and what ability they had to the interests of the rate-payers were to be browbeaten and pestered with communications such as that already read on the slightest possible pretext.

The Chairman: We have already passed from that letter. I hope you are not now going to make a reply to it when you had an opportunity before. It would be very unfair. Keep to the point of your motion.

Mr. M'Kenzie: I understand he is simply showing reason why this journal should be here.

Mr. Blair: The Chairman cannot see it in that clear light, and hence this interruption.

Dr. Chalmers seconded the motion.

Mr. Ogilvie moved the previous question.

Mr. Bowman seconded the amendment.

Mr. Martin said he had considerable sympathy with Mr. Blair's motion. He did not think everything was going on so satisfactorily as some members seemed to think.

The motion was carried by seven votes to five.

MAINTENANCE OF STREETS AND ROADS.

A LECTURE was given at the last meeting of the Carlisle Architectural, Engineering and Surveying Association by Mr. J. Hepworth, C.E., on "Our Streets and Roads." Having referred to the favourable situation of Carlisle for procuring paving material, and also that notwithstanding this it is sometimes alleged that the cost of the present methods of paving is greater than the circumstances call for, he invited the views of the members present on the question as to whether there are any other materials suitable, but of a less costly character than granite or whinstone, that might be introduced. The lecturer mentioned the following requirements of a good carriage-way pavement:—It must be a sanitary pavement and as noiseless as possible. It must be safe for horses and afford a sufficient foothold with a minimum of traction. It must be as free from mud and dust as possible. It must be economical not only as regards first cost but also with respect to its maintenance and cleansing. It must be durable. It must be easily cleaned and non-absorbent of moisture. It must admit of being readily taken up and quickly relaid for repair at all seasons. He then proceeded to consider the advantages of tar paving as a class of pavement for which it is claimed that most of the above requirements are met at a proportionately small

ESTABLISHED 1860.

cost, and remarked that although there is much difference of opinion amongst surveyors about its adoption, the towns of Cheltenham, Shrewsbury, Harrogate, Scarborough and Nottingham almost exclusively use tar paving in the principal and residential streets with great success, at a cost of from one-third to one-fourth that of granite and whinstone paving, and stated that on hygienic grounds tar macadam is undoubtedly to be preferred. The lecturer read several specifications for the mixing and laying of tar paving, and quoted the opinion of several authorities who, after a proper trial, have reported most favourably on its adoption in residential streets and back lanes. The objectionable feature of the smooth surface and the black look of the roadway are easily overcome by proper mixing and laying and the finished coat being made with a light-coloured and gritty material. A discussion followed.

THE ELECTRIC LIGHTING OF GLASGOW.

A PAPER on "The Corporation Electric Light Supply" was read to the members of the Institution of Engineers and Shipbuilders in Scotland by Mr. William Arnot, electrical engineer to the Corporation of Glasgow. He described in detail the machinery and other fittings at the Waterloo Street station, where, he said, they had made ample provision against any accident that might happen. The total output of the dynamos was 1,189,900 watts, or 1,190 units. Describing the underground work in the streets, Mr. Arnot said that a copper strip was laid on porcelain insulators in iron culverts, which were watertight. He did not mean that under a pressure they would keep out water, but owing to their construction, the lids overlapping the culverts, the ground in which they lay must be flooded before the water could rise high enough to enter through the seam. He had never known an instance of water in the culverts. Water did collect in the brick junction boxes, especially in Bath Street and districts where there was heavy clay soil. Provision was made in all such for their thorough drainage. Where it was not possible to lay copper strip, indiarubber-covered cables had been laid in cast-iron pipes. Faults in the underground mains were easily found by means of a compass needle. The needle was placed on the faulty conductor, and brought to be parallel with it by means of a strong directing magnet. The other conductor was flashed to earth, and the direction of the excess current due to the fault was noted. In this way it was easily traced. Nearly

all the faults were caused by careless workmen. The last fault was in Renfield Street, and was traced in half an hour. There were now 382 consumers, who had applied for a current of 15,487 ampères, which represented roughly 46,460 eight candle-power 33-watt lamps distributed somewhat as follows:—242 shops, 7,776 ampères; 21 warehouses, 2,680 ampères; 91 offices, 3,269 ampères; 3 churches, 229 ampères; 12 private houses, 275 ampères; and 13 clubs, hotels and theatres, 1,258 ampères. They had not had a year's run at the station yet, and it was therefore impossible to give figures as to cost of production, &c. It was only right that he should say that the successful issue of their winter's labours had been due in a very great measure to the staff that had worked with him, and he wished to express his personal appreciation of their services.

ZINC AND ZINC ROOFING.*

(Concluded from last week)

I WILL now mention some of the different systems of zinc roofing recommended by the Vieille Montagne Company and others. The roll-cap system is laid on boarding, and on this boarding, at intervals of about 2 feet 10 inches or 2 feet 11 inches c. to c., wood fillets are fixed while the roofing is being laid. These run from ridge to eaves. Roughly speaking, the sheets of zinc are laid between these rolls with their side edges turned up against the rolls, and the edges and roll are then covered with a capping of zinc. If the roof has a fall of 1 foot in 8 or upwards, then only a welt or fold joint at the junction of the sheets is required. In the case of flatter roofs, if possible a fall of 3 inches in 10 feet should be obtained. In such flat roofs, however, a drip should occur at about every 7 feet 6 inches. The drips should be 2½ inches deep, and not less than 2 inches, to allow the rolls to pass well under the projecting upper sheet.

If laid with the drawn roll the drip will require to be 3½ inches deep. Zinc flats may be set out with drips 8 feet 6 inches apart and 9 feet 6 inches apart for special cases, provided a sufficient time is given for the sheets to be specially rolled and prepared; but it is not recommended, as the long

OFFICE, 175 STRAND, LONDON, W.C.

sheets do not lie as well in consequence of the expansion and contraction of the metal. In the roll-cap system the section through a roll is somewhat of a wedge section, with the point of the wedge cut off; the clips that pass under the wood rolls are about 2 inches wide, and placed about 3 feet apart along the roll. The cap is secured by forked connections; these are pointed pieces of zinc 2 or 3 inches long by about an inch wide, one end of which is soldered to the inner surface of the cap on each side, the point being free; as the cap slides on to the roll the points of these forks slip in under the hooked portion of the clip. The stopped end of the roll cap on the upper level of the drip is bent over with the edge of the sheet. In gutters where the incline is very slight, and soldered joints are therefore necessary, an extra allowance of play should be provided for expansion and contraction by placing a sort of roll system across the gutter at its highest points. For gutters $1\frac{1}{2}$ to 2 inches drips should be allowed, except where it is necessary to put a roll in the centre, and in this case they must not be less than 2 inches. Wall flashings should go into the wall $1\frac{1}{2}$ inches; they are very similar to lead, and for strength to stiffen the edge and for appearance should be finished with a bead and pointed in cement; the edge of the sheet should be turned up about 6 inches against the wall. Valley gutters should have a fall of at least 3 inches in 10 feet. In laying zinc work, in almost all cases no solder, nails nor external fastenings are to be used, each sheet or portion of metal should be laid free and unconfined. The lower edges of the sheets nearest the eaves are strengthened where they project over the gutter by being doubled back so as to form a bead, and also by a strip of strong zinc nailed along the edge of the boarding over which the bead is turned. The ridge can be covered by a zinc roll cap turned over it; this cap is strengthened on the lower edges by their being bent round to form beads, and it is fixed with clips in the usual way.

The incline of zinc roofs constructed as before mentioned should be from, say, 20 deg. to 36 deg., whereas for slates or tiles it is from, say, 32 deg. to 45 deg., consequently this system of roofing requires lighter framing and less brickwork in the height of chimneys and gables, &c., and there is also less surface to cover, owing to the lower pitch of roof. Zinc roofs have also zinc gutters and flashings, and the extra cost of such leadwork in ordinary roofs is thus also saved. In cases of greater or less pitch than 20 deg. to 36 deg., it is better, the Vielle Montagne Company say, to adopt the patent roll-cap system; this is similar to the ordinary roll-cap construction,

excepting that there are differences in the shape of the wood roll, the roll cap and the clips.

The Vielle Montagne Company recommend their patent drawn roll cap for flats of warehouses, &c., where weights are stored or where there is much walking about, and for appearance in high-pitched roofs; in this system the loose roll cap is dispensed with, the zinc being drawn tight over the roll by machinery. The weight of a square of zinc roofing, roll-cap system, 13 gauge, is about 130 lbs., and 16 gauge 192 lbs.; corrugated work, 13 gauge, is about 136 lbs., and 16 gauge 198 lbs. When zinc is required to be laid, not upon boarding, it is strengthened by corrugations. Ordinary corrugated zinc has the flutes about $3\frac{1}{2}$ inches wide, and rests upon spars about 2 feet 6 inches apart. Zinc roofing thus constructed has the advantages of both strength and durability owing to the corrugation. I may perhaps also mention that the corrugation in itself in great measure overcomes the difficulty of expansion and contraction—at any rate, this is the case across the sheets or corrugations. It can be easily laid upon a light framework of wood or iron; it is unnecessary to have boarding. The minimum incline of these roofs should be about 22 deg., the lap in the width of the sheets should be from $3\frac{1}{2}$ to 4 inches. The sheets should not be rivetted together; they can be sufficiently fixed with clips, that is to say, three slips of zinc are soldered to the underside of each sheet, and these hook on to similar hooks fixed to the wood framing, or they can hook on to iron purlins. The corrugations are of three sizes, $2\frac{3}{8}$ inches, 3 inches, and $3\frac{7}{8}$ inches c to c. Patent corrugated zinc, with flat spaces between the corrugations, is another form of corrugation often preferred. Double-ribbed zinc roofing may be laid on boarding or on laths or battens.

The double ribs give extra rigidity to the sheets. The tops of the sheets are nailed to the woodwork under the overlap of the sheets above them, and the upper sheets are fixed with a fork connection on the inner face of the ribs. The length of the lap varies, according to the incline of the roof, from $2\frac{1}{2}$ inches to 6 inches; the smaller the inclination, of course the longer is the lap, to avoid capillary attraction. Corrugated zinc may be laid like corrugated iron, with the flutes horizontal, so that the sheets will span wider spaces between principals without any intervening rafters or purlins. In such a case, however, the flutes must be of a peculiar angular stepped form. In Italian corrugated zinc roofing the corrugations are 1 foot 3 inches c to c. A great advantage is that it may be laid without boarding upon rafters spaced and

Shorland's Inlet and Outlet Ventilators in every Design.

shaped to fit into the corrugations; or it may be laid on boarding. The sheets are secured to the rafters by patent holding-down clips. The lap of the upper sheets over those below them should be about 5 inches. The rafters rest upon purlins which, in large roofs (owing to the lightness of this system), may be 10 feet apart; the depth of the rafters or rolls should be about 3 inches when resting upon purlins 7 feet apart, but when laid upon boarding, 2 inches deep is enough. The wood rafter can be any depth and width, but 3 inches by $1\frac{3}{4}$ inches is large enough; if the rafters are wider, then the upper part, to a depth of $1\frac{1}{4}$ inches, must be worked to receive the corrugations of the metal. The ridge roll is covered with zinc nearly in the same manner as with lead, except that the zinc is not worked so much into the angles under the roll, and it is secured on the under-side by forks. Valley gutters are also formed in somewhat the same manner as with lead. For roofs laid with wood rolls the wooden trough is lined with sheet zinc, the sides of which are turned up and the upper edges bent inwards under the bead formed by the lower edge of the sheet at the eaves. Where Italian corrugated zinc is used, the sides of the zinc lining to the gutters are turned up and the edges bent over the thickness of the wood sides of the trough; the minimum fall of such gutters should be $\frac{1}{4}$ deg. The following is the approximate weight when laid, including corrugations and laps, for 100 super feet:—Square roll cap, 14 gauge, 144 lbs.; Italian corrugation, 150 lbs.; square roll cap, 16 gauge, 192 lbs.; Italian corrugation, 198 lbs.

In the zinc tile system the tiles are generally fixed on boarding with clips or hooks, and are well adapted for high-pitched roofs. They can be fixed with ease, even by unskilled men. Each tile is hung from a hook fixed upon battens or boarding, and passing through a hole near the top of the tile. The ordinary size of square tiles are $10\frac{1}{2}$ inches, $13\frac{1}{2}$ inches and 17 inches square, and for large buildings they are $23\frac{1}{4}$ inches or 29 inches square; 13 gauge is enough for the smaller tiles, but the larger ones should be 14 or 15 gauge. There are other forms of zinc tiles, such as diamond-shape, ribbed, stamped, scale-pattern, &c., all fixed with clips in slightly different ways. The Vielle Montagne Company suggest, in their publications, that zinc in tiles or sheets may be used for covering and preventing dampness in walls. Zinc eaves gutters are hardly strong enough to bear the weight of snow or even the pressure of a ladder; they require stays or hollow tubes of zinc placed across the top of the gutter about 18 inches apart, through which is fixed the screw fixing the gutter to the woodwork; the stay keeps the upper part

of the gutter from bending inwards as the screw is driven in. Among other purposes for which zinc is used I may mention the following:—Small spelter cakes are used for galvanic batteries, and larger cakes, weighing about 30 lbs. each, are prepared for the zinging or galvanising of iron articles; being very sonorous, it is suitable for speaking tubes, and is also used for tubes for bell wires, and as nosings to protect stair treads, for chimney-cowls, wires and baths; these do not rust like iron nor chip like enamel baths, and the water does not cool so rapidly as in other cases. It is safer not to use zinc for cisterns lest the water should perchance be such as would cause them to decay. Perforated zinc is made of endless pattern, and is suitable for ventilating purposes to dairies and other openings, for window blinds, and as a covering for hot water or steam pipes, and for various domestic and other purposes. Zinc nails for slating vary from 1 to 2 inches in length.

Laxton's "Price Book" for 1893 gives zinc slating nails at 6d. per lb. I may, perhaps, also give the following information as to measuring and prices:—Vielle Montagne zinc 15 gauge is 8d. per foot super, and is measured net over surfaces of flats and add for the necessary turning and laying. Zinc roll cap, $2\frac{1}{2}$ d. per foot run; bossed ends to ditto, $1\frac{1}{2}$ d. each; secret tacks or slips, 2d. each; bossed or soldered angles, under 4 inches high, 4d. each; 3-inch to 5-inch half round and ogee eaves guttering varies in price from 5d. to $8\frac{1}{2}$ d. per foot run; 2-inch to 4-inch round rain pipe is from 5d. to $8\frac{1}{2}$ d. per foot run; 3-inch to 4-inch octagon rain-water heads are 5s. 6d. to 6s. 6d. each; 3-inch and 4-inch shoes are 1s. 6d. and 2s. 4d. each. The average cost of zinc roofing with sheet zinc and drips is 55s. per 100 super feet.

Mr. Edmeston has stated that the roof of the London and North-Western Railway at Birmingham (area 108,696 feet), covered with galvanised iron, cost 3,600l. to paint in twelve years to prevent decay, and the cost to cover this area with zinc would not exceed 3,397l. This has now been since covered by degrees with zinc and no longer requires painting. I may mention that paint does not readily adhere to sheet zinc unless it is first washed with one or other of the necessary solutions, or a thin coat of liquid size will make any oil colour adhere to zinc should this be required for any purpose.

Galvanised iron being composed of two metals which are subject to different laws as to expansion and contraction is therefore liable to have its coating crack; it is also apt to have it decay and unless frequently painted it splits off in time. Pure and solid zinc, however, remains sound and is in great

Wrought-Iron Work. Stained Cathedral Glass, and any other Interior Work.

measure preserved from further decay by the coating of oxide which forms upon it, and when once properly laid requires much less repair than other roofs do. It is, perhaps, hardly a matter for architects to consider much, but it is maintained that zinc when taken off roofs, &c. equals 40 per cent. of the original value, whereas galvanised iron when stripped off is of much less value.

Zinc forms a component part of several useful alloys, and the oxide of the metal is used as a basis for zinc paint. I shall, however, suggest and leave zinc paint as a subject for some other gentleman to volunteer to take up at a future lecture. Almost all the metals combine with zinc, and some of its alloys are of great importance. English brass is one part of zinc to one of copper. Dutch is one to two. The "Encyclopædia Britannica" says two atoms of zinc to one of copper is best. Muntz's yellow metal of Birmingham, used as sheets for sheathing, contains 40 per cent. of zinc to 60 of best copper. Bronze is composed of copper, zinc and tin, of which vessels have been found at Nineveh and Herculaneum. In 1844 some building sheds in Portsmouth Dockyard were first covered with zinc, since which time its use has become more general in this country. The sales of the Vielle Montagne Company of zinc for roofing purposes alone in the United Kingdom increased from 880 tons in 1867 to 3,500 tons in 1881. I may mention that if architects use a reliable zinc, such as the Vielle Montagne, and have it laid by a reliable firm, such as Messrs. Braby, of Euston Road, London, they have nothing to fear. I shall, however, as supplementary to this advice, in conclusion just mention a few points as suitable for a specification for good work, selected in part from the last edition of Gwilt's "Encyclopædia." The roofs and flats are to be covered with No. 15 gauge malleable Vielle Montagne zinc fixed with holding-down clips, improved solid stopped ends and ridge plate; the zinc sheets to overlap each other 6 inches, and to have rolls 1½ inches wide. The zinc is to be turned up 5 inches all round against walls or skylights, and to be finished with flashings 6 inches wide inserted an inch into the joints of the brickwork, and secured by galvanised iron wall-hooks. Cesspools are to be formed at the head of the rain-water pipes and the zinc well lapped over. The whole to be laid with shotted fastenings lapped at angles. Gutters to be laid with 6-inch laps at drips, and to be turned up under slates for 11 inches. Finally I desire to state that there seems to be no book dealing with the subject I have brought before you to-night, and I am simply indebted to my

experience and memory in connection with the matter; also perhaps in part to a paper read before the Royal Institute of British Architects in 1860 by my former master, Deputy Alderman Edmeston, entitled, "An Examination of Existing Facts relating to Zinc Work on the Continent" (it is, however, about ten years since I myself read this pamphlet). I have also obtained scraps of information from various publications already I think mostly mentioned. I also thank Messrs. Braby and the local Vielle Montagne agents for information and for the use of samples and models, &c.

THE

Architect and Contract Reporter.

SPECIAL NOTICE TO THE TRADE
AND OTHERS.

[Extract from a lecture on Architects' Libraries by Professor T. Roger Smith, F.R.I.B.A., at University College, October 10, 1893.]

"Lastly, let me recommend the back volumes of the professional journals. In the course of years all sorts of architectural topics come up in the public press and before the professional societies, and if you hunt through the indexes of these publications when you are seeking for information which eludes you in books, you will often be rewarded."

There has been a considerable demand for the back numbers of *The Architect* during the last three or four months, which we have no doubt has arisen from the remarks made by Professor Roger Smith, as contained in the above quotation; but the consequence has been that our stock of back numbers is getting very low, and consequently, in future, the charge for back numbers of previous date to January 12, 1894, will be 6d. each.

A few of the back volumes may still be had, price 12s. each.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested as much as possible to make their communications brief. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

WILLINGTON.—April 17.—For Taking Down and Rebuilding the Pit Laddie Hotel. Mr. W. Cook, Architect, 59 Saddler Street, Durham.

WE hear that Messrs. Perken, Son & Rayment ("Optimus"), of Hatton Garden, London, had the opportunity of displaying their new safety saturator for optical lantern illumination at the meeting of the Royal Institution of Great Britain in Albemarle Street, Piccadilly. The instrument was shown in a bi-unial lantern, one saturator supplying the two jets. The light was switched off and on from the upper to the lower lantern and *vice versa* with great rapidity. Several members of the company present themselves manipulated the instrument, and expressed their great satisfaction at the simplicity and perfect success of the dissolving arrangement. By way of experiment, one or two gentlemen tried to snap out the light, but were gratified to find it quite impossible so to do. The room was illuminated by brilliant electric lights during the time these experiments were conducted, still the transparent photographs projected on the screen were well illuminated and much appreciated.

The largest and best variety of Fanlights and Sash Openers, &c., to suit all requirements, viz. details of work and price, to work by means of the Vertical Screw Rod and Regulator, or Cord.

SPECIALTIES—Door Springs, Fanlight Openers and Gear, Ventilators, Locks and Furniture, Builders' General Ironmongery, Iron Casements and Frames, Architectural and other Metal Work, &c. &c.

ROBT. ADAMS, Building Trades Emporium, 67 Newington Causeway, London, S.E. [Telegrams:—"Robert Adams, London."]

ROBT. ADAMS'S Patent

Ventilating Apparatus for

Continuous Sashes of

Lantern Lights,

Conservatories, &c.

Number of Patent, 16,610,

Dated December 2, 1887.

THE PULLMAN SASH BALANCE.

By means of this Valuable Invention all Sashes may be properly counterbalanced and all further annoyance from frayed and broken cord entirely obviated. The PULLMAN SASH BALANCE is warranted for TEN YEARS on ANY WEIGHT OF SASH, and if Worn Out BEFORE the End of that Period will be Replaced FREE OF ALL CHARGE.

They COST LESS than Weights and Cord and Last THREE TIMES as Long.

They can be applied to Old or New Windows.

The Expense of Box Frames is Saved.

Can be seen in Use at the Offices of the Sole Agent,

No. 203. Special thrust-motion round section Bolt, suitable for very narrow stiles. It can be fixed where the space is insufficient for anything else. This Bolt is neat, strong and reliable.
